No. Trees Tapped _____

other farm work in the spring often delays the cultivation of the orchard until along in June. Cultivation will not give the best results at that time; in fact harm may be done by deep plowing cutting off the new growth of feeding roots which has taken place. Cultivation started early may stop early, say by July. This will cause an earlier maturity of the wood which is advantageous.

Get Better Color. Probably the most important advantage in an earlier period of cultivation is the influence on color. The earlier cessation of growth will have a distinct tendency to improve the color of the fruit.

Grafting Pointers

Select limbs carefully, so that a well-shaped tree may be developed; keep scions dormant until used; make cuts smoothly so stock and scions will fit

Whip-grafting—this shows the four steps in the operation.

snugly; be sure cambium layers are in contact; do a thorough job of waxing.

For use as a cold wax, the following formula is suggested; resin 4 pounds,

Inlay-grafting—scions cut ready for nailing in; bark on stock removed, exposing cambium cells; scions nailed in place; cut surfaces thoroughly waxed.

beeswax 2 pounds, tallow 1 pound. The following formula is satisfactory for a hot wax to be applied with a brush: resin 6 pounds, beeswax 2 pounds, raw linseed oil 1 pint, powdered wood charcoal $\frac{1}{2}$ pound.

Varieties of Small Fruits for New York

Black Raspberries

Plum Farmer.—Early. Large, gray bloom, firm, sweet, very good, productive, excellent for shipping or evaporation; now probably the leading variety in western New York.

Cumberland.—Midseason. For many years the standard blackcap, but now surpassed in popularity by Plum Farmer.

Red Raspberries

June.—Early. Large, firm, productive, excellent for shipping; now being widely planted; not resistant to mosaic but will yield to control measures.

Ontario.—A day or two later than June and almost identical with it.

Herbert.—Midseason. An outstandingly good variety for home use or local market, but rather too soft for shipment; resistant to mosaic.

Cuthbert.—Standard main crop, and still ahead of any other variety for commercial purposes; not resistant to

mosaic but will yield to control measures.

Purple Raspberries

Columbian.—Late. Very hardy and productive; unsurpassed for canning; the standard and most widely grown purple cane.

Royal Purple.—Valuable for its lateness, being ten days later than Columbian; very hardy.

Blackberries

Eldorado.—Medium early. Exceptionally high quality, productive, hardy, and rust resistant; very popular in western New York.

Ancient Briton.—Midseason. A standard commercial sort; noted for its hardiness, productiveness, and high quality, although somewhat lacking in size.

Taylor.—Late. The standard late blackberry; hardy and rust resistant, but not always as productive as desired.

Dewberries

Lucretia.—Medium early. The most widely grown and most popular of all dewberries, although dewberries are none too satisfactory under northern climatic conditions.—C. E. B. No. 64.

Culture of Small Fruits

Strawberry.—Propagates by serpentine laying runners.

Plant in the spring.

Cultivate clean with a winter mulch.

Prune thin runners.

Manure and cover crops prior to

planting is the best fertilizer practice, the spring.

Cultivate clean with a cover crop.

Black Raspberry.—Plant tip-layer in Cut out old canes. Pinch back in the summer. Head-in in the spring.

If growth is not satisfactory apply nitrate of soda or a light application of manure.

Red Raspberry.—Suckers and root cut

Planting Distances for Permanent Trees

	Feet
Apple	35 to 50
Pear	22 to 30
Quince	18 to 20
Peach and apricot	20 to 25
Sour Cherry	20 to 25
Sweet Cherry	25 to 35
Plum and Prune	18 to 25

tings are planted in the spring.

Cultivate clean, with a cover crop.

Cut out old canes. Head-in canes in the spring.

Fertilizer practice the same as for black raspberry.

Dewberry.—Same cultural practice as for red raspberry with the exception that stable manure is the best fertilizer.

Blackberry.—Propagated by suckers or root cuttings in the spring.

Prune all wood over three years old and cultivate clean with a cover crop. Stable manure is the best fertilizer.

RED RASPBERRIES

The most delicious of small fruits

Berries large, firm, quality good, very productive, ripens early, brings highest price on market. Perfectly hardy in temperature of 35 below.

VIKING
New Red
RASPBERRY

All orders will be filled with plants, guaranteed true to name, certified free from disease, from the originator's farm, Prof. F. C. Reeves, Canadian Horticulturist, Prince Edward Island.

Send for Catalog and let us tell you more about this splendid variety that leading Farm papers and Experimental Stations have referred to so favorably.

Good strong plants, well rooted, \$1.00 per dozen. \$3.00 per 100, 25 or over at 100 rates.

The leading commercial varieties at greatly reduced prices.

Trees of genuine merit, strong, healthy, well-rooted, satisfaction-giving trees, that is the only kind we sell. This is the sort you can depend upon to give you the best results within the shortest possible time. Our catalog will tell you more about our products.

It's free.

CERTIFIED RASPBERRY PLANTS

Latham, Viking, Chief, Herbert, St. Regis, Cuthbert, Plum Farmer, Columbian, etc. Strawberries, Blackberries, Asparagus, Fruit Tees, Evergreens, Shrubs, Roses, Perennials. All guaranteed. Prices very low. List free. Bert Baker Hoosick Falls, N. Y.

Top-dressing at blossom time

means extra profits at harvest time

Better quality—bigger yields—extra profits. These are the rewards at harvest time for top-dressing two or three weeks before blossom time with plenty of nitrogen.

Whether you use mulch-grass or tillage cover-crop method of culture, Arcadian Sulphate means larger yields. Experienced growers have found that the application of increased quantities of nitrogen gives correspondingly higher yields. A group of orchardists who made demonstration tests actually increased yields with Arcadian Sulphate of Ammonia from 50% to 233% by top-dressing.

Arcadian Sulphate has a guaranteed 20.56% content of quickly available nitrogen—easily applied—packed in 100 lb. bags for convenience; 200 lb. bags for economy.

Order Arcadian Sulphate of Ammonia from your fertilizer dealer when you buy your mixed fertilizer.

ARCADIAN

REG. U. S. PAT. OFF.

SULPHATE of AMMONIA

NITROGEN IS THE GROWTH ELEMENT

As essential as sunshine to growing crops. Be sure your crops get plenty of nitrogen both in the complete fertilizer you use and as side-dressing.

How to Get Better Crop Yields

The Potato Outlook

Growers of potatoes have indicated that they intend to increase acreage 6 per cent in 1931. The acreage of potatoes harvested in 1930 was only a little more than 1 per cent greater than the average harvested in 1929. Yields per acre were cut by weather conditions, resulting in only a moderate crop.

If a 6 per cent greater acreage is planted this year and the weather is favorable, it would appear that a greater crop will be produced than can be sold at a fair price. This increase would mean a total of 3,583,000 acres, and with normal yields it would produce approximately 421,000,000 bushels, practically equal to the large crop of 1924. The 1930 crop was around 361,000,000 bushels.

The 1930 crop brought about an average price of 90 cents a bushel De-

middle of June and then allowed to produce a crop of seed.

4. Sweet clover may be allowed to stand until in full bloom or even a little later when it may be made into silage. Any growth occurring after silage harvest may be grazed off.

NOTE: Sweet clover is a biennial and nearly always completely dies out at the close of the second season.

When to Cut Hay

Alfalfa.—When first blooms appear, but preferably when new shoots growing from the crown are about an inch high.

Red Clover.—From full bloom to when the heads are half brown.

Alsike.—Just as the first blooms appear, or a little before.

Soy Beans.—When the pods are ripe.

Sudan Grass.—Full bloom, but little deterioration occurs if allowed to stand longer.

Millet.—Just after blooming for horses, when seeds are in milk stage for cattle and sheep.

Sorghum.—When seed are in early dough stage.

Emergency Hay Crops

1. Oats—Oats for hay should be cut at just the right stage, which is just as they begin to turn in color.

2. Oats and Canada field peas. (One bushel of each per acre).

3. Oats and spring Vetch.

4. Millet—This crop is planted about the same time as corn. It needs a fairly fertile soil and the hay needs careful and thorough curing.

5. Soy Beans. Plant around corn planting time. Inoculate the seed. Use about 90 pounds of seed per acre, broadcast.

How to Kill Quack Grass

Quack grass roots are largely confined to the top three or four inches of the soil. Fall plowing exposes these roots so that they are frozen in the winter time. If the grass shows leaf growth one or two harrowings should be made later that fall. Then in the spring cultivate the ground as soon as it is dry. Repeat cultivation frequently enough to prevent green growth. If this program is kept up until the crop is planted, quack grass is usually so weakened that little trouble will be given.

For the corn or potato field, harrowing in the fall with a heavy harrow is probably the best method. Then in the spring, the land should be harrowed again and the crop delayed as long

as possible. The idea is to prevent growth of the quack grass until the crop has made a start. Two successive years of such treatment will kill out almost any stand of quack grass.

How to Mix Bordeaux

In mixing Bordeaux, it is advisable to have 4 barrels. One barrel should contain a stock solution of copper sulphate (blue vitrol) made by dissolving 25 pounds of copper sulphate in 25 gallons of water. Barrel No. 2 should contain 25 pounds of hydrated lime and 25 gallons of water. In barrel No. 3, put 42 gallons of water with 8 gallons of the stock copper sulphate solution. In barrel No. 4, 42 gallons of water with 8 gallons of the stock lime solution. Mix barrel No. 3 and barrel No. 4 as they enter the sprayer. If the spray tank holds only 50 gallons, barrels No. 3 and No. 4 should contain only half as much.

Pressure Used Affects Value of Spraying

YEARS ago experiments were conducted to show the increase in potato yields due to spraying. Now it has been generally accepted that spraying will increase yields but frequently too little attention is paid to methods of spraying.

In 1929 records were kept on 77 New York potato fields and the results show that potatoes sprayed at a pressure of 300 pounds produced an average of 7 bushels an acre more than fields sprayed with a pressure of 200 pounds. One field where the pressure was 400 pounds produced 36½ bushels more than fields sprayed with 200 pound pressure. In all probability part of this increase was due to the fact that more material was applied where higher pressure was used.

Ills of the Cabbage Patch

CABBAGE, as we all know, is subject to several diseases. Any of the worst ones may knock out our crop prospects if they aren't warded off. We cannot allow that, for cabbage is full of vitamins that we all need in our systems, besides being a money crop for lots of us. So let's study a few of the ill's of this grand old garden friend.

BLACK ROT: Starts usually on the older leaves which turn yellow and die, with the veins showing a blackish hue. Next, the head rots with a vile odor. The remedy is to rotate crops, and soak the seed for 20 minutes in one

part of formaldehyde to 200 parts of water. Then rinse in clear water and dry.

CLUB ROOT: An enlargement of the roots which results in stunting the plants. There are two cures—rotating crops, and applying 90 bushels of burnt limestone to the acre, six months before planting out the cabbage. Best to do both.

BLACK LEG or WILT: Begins usually on the stems near the ground, as irregular sunken patches having small black spots on them, but may start on the edges of the leaves in the big veins. It works down into the roots and

Crop Distribution As Shown by Monthly Shipments of Early and Late Potatoes

rots them off. Dying plants often have a purplish tint. This disease is most common on young plants, being a severe seed bed disease, but may also attack older plants.

The remedy is to sterilize the seed bed or spray the seedlings with weak Bordeaux mixture. Also, rotate crops.

YELLOW: The outer leaves turn yellow, usually two to four weeks after planting out, though sometimes sooner, and then drop off—looking scorched. Later only the bare stalks may be left with small heads at the tips—no pronounced rotting as in black rot.

The remedy is the same as for black rot—seed treatment and rotation,—also growing resistant varieties, such as Volga, Houser, and Wisconsin Hollander. In rotating crops, it is no use planting cauliflower, kohlrabi, turnips, kale or rape to clean the cabbage ground of disease germs. These crops are all related to cabbage and subject to the same diseases.—ELMER WHITTAKER, Segregunsett, Massachusetts.

Time Required for Plowing

A three-year study on 23 farms in Putnam county shows that a ten-hour day is required to plow 1.7 acres with a 14-inch plow in fields of less than six acres. In the same time two acres may be plowed in fields of between six and twelve acres, and 2.2 acres in fields of more than twelve acres.

If two 12-inch plows are used with a tractor, the saving is even greater in the larger fields. In a ten-hour day, 5.3 acres can be plowed in fields of between six and twelve acres, and in fields containing more than twelve acres the same plow will turn under 6.4 acres of soil a day.

Similar relationships exist in time required to cultivate corn in various sizes of fields. A two-row cultivator will work 8.2 acres in fields of less than six acres, and 11.8 acres if there are more than twelve acres in the field.

How to Control Crows

Around the poultry yard and sprouting corn field, it is sometimes necessary to find control measures for the crow nuisance.

The use of coal tar or a commercial crow repellent applied to the seed has had considerable success in protecting

(Continued on Opposite Page)

Seeding Rates for Common Crops

Alfalfa.....	15-20 lbs.

Timothy.....	15-25 lbs.
Wheat.....	6-9 pks.

cember 1, 1930, compared with \$1.31 per bushel on December 1, 1929, in spite of the fact that the two crops were about the same size. The difference represents the reduced purchasing power of consumers and the general lower level of food prices.

For the balance of the spring, it is estimated that the volume of early potatoes from the South will be greater than it was in 1930. Consequently old potatoes on hand will meet stiffer competition than they did a year ago.

How to Grow Alfalfa

1. Use a hardy variety—Grimm, Ontario variegated or northern grown Common.

2. Inoculate the seed.

3. Lime the soil (ask your county agent to test the soil for lime requirement).

4. Prepare the land thoroughly and seed between June 15 and July 1.

5. Sow on well prepared soil only.

6. Topdress new seeding with manure or superphosphate (superphosphate will give less trouble from weeds.)

7. Do not cut too close in the fall. Allow the seeding to go into the winter with a 6-inch growth.

How to Manage Sweet Clover

First Season

1. The crop may be pastured lightly during the fall where good soil conditions have favored a large growth. Too close grazing under less favorable soil conditions may reduce the yield the second season.

2. It may be cut for hay but the stubble should not be left too short. The fall growth of new sweet-clover seedlings is better for hay making than any other produced by the plant.

Second Season

1. The crop may be pastured closely the entire season.

2. It may be pastured in early spring while the regular pastures are getting a good start; after a period of rest, a crop of hay may be cut.

3. It may be pastured up to the

SASH

Size 3 ft. x 6 ft. \$1.55
Painted, two coats, no glass . 1.85
With double thick glass 4.00

The quality product of America's largest hotbed
sash mill. Genuine tidewater red cypress, select
grade. Joints blind, well mortised, tight-fitting.
No knots or checks. Smooth finish and sides ab-
solutely parallel to prevent gaps that let cold in.

Pure white lead paint applied by a process that
fills all corners, etc. Double thick glass bedded in
special putty of our own grinding.

These sash are extra strong to stand any weather
for years without rotting, weakening or paint and
putty chipping. Easily the best you can buy. Sat-
isfaction guaranteed.

Low price also on greenhouse construction ma-
terial or complete erection, including heating and
benches.

Seeds—Dahlias and Gladioli. Write for a copy.
W. ATLEE BURPEE CO.
11 Burpee Building—Philadelphia

(Continued from Opposite Page)

sprouting corn from the crows. Use
in proportion of about a tablespoonful
to half a bushel of seed grain, the
grain having been previously heated
with the application of warm water,
and then drain. Stirring of the grain
will result in an even coating of tar.
When thoroughly dry, it may be used
in the planter.

Judicious use of poison may ma-
terially lessen crow damage. The
state laws and local regulations must
be observed in the distribution of the
poison, especially the thickly settled
regions. Corn steeped in a strong
strychnine solution is the bait usually
employed. Put two tablespoonfuls of
starch and one ounce of powdered
strychnine alkaloid in 1½ pounds of
water and heat to boiling. Stir in
thoroughly after the starch begins to
thicken. Pour this mixture over 20
quarts of corn and stir until every
kernel is coated. When dried, bait
may be used to advantage, scattered
along the rows. Wholesale destruction
through poisoning is difficult but the
killing of a few will usually put a
stop to the depredations.

Best Vegetables for New Jersey Gardens

; Announcement of an improved list
of vegetable varieties that are espe-
cially adapted to New Jersey's climatic
conditions has just been made by the
Department of Vegetable Gardening at
the New Jersey Agricultural Experi-
ment Station.

This list, which has been prepared
as a guide for both commercial grow-
ers and home gardeners, follows:

Asparagus: Mary and Martha Wash-
ington strains, Reading Giant, and Pal-
metto.

Beans: (green bush) Stringless
Green Pod, Bountiful, Black Valentine;
(yellow bush) Improved Golden Wax,
Currie's Rustproof; (green pole) Ken-
tucky Wonder, or Old Homestead; (yel-
low pole) Golden Cluster; (bush lima)
Improved Fordhook; (pole lima) King
of the Garden, Challenger.

Beets: (early) Crosby's Egyptian,
Early Wonder; (late) Detroit Dark
Red.

Swiss Chard: Lucullus.

Broccoli: Calabrese.

Brussels Sprouts: Long Island Im-
proved.

Cabbage: (early) Jersey Wakefield,
Copenhagen Market, Golden Acre;
(mid-season) Succession, Glory of
Enkheisen; (late) Danish Ballhead,
Flat Dutch.

Carrots: Chantenay, Danvers Half
Long.

Cauliflower: Snowball.

Celery: Golden Plume, Early Blanch-
ing (green).

Sweet Corn: (early) Whipple's
Early White; (second early) Howling
Mob, Vanguard; (late) Late Mammoth,
Long Island Beauty; (yellow) Golden
Bantam, Whipple's Early Yellow.

Cucumber: Davis Perfect, White
Spine, Early Fortune.

Eggplant: New York Improved,
Black Beauty.

Endive: Green Curled, Broad Leaved
Batavian.

Horseradish: Bohemian or Maliner
Kren.

Kale: Scotch Curled (fall), Siberian
(wintering over).

Kohl Rabi: White Vienna.

Leek: American Flag, Giant Mussel-
burgh.

Lettuce: (spring) Black Seeded Big
Boston, Salamander, New York, White
Boston; (fall) Improved Big Boston;
(romaine) Express, Trianon.

Muskmelon: Early Knight, Improved
Jenny Lind, Hearts of Gold, Fordhook,
Hales Best.

Okra: Perkins Long Pod.

Onions: (sets) Yellow Strasburg or
Japanese; (seed) Yellow Globe, Dan-
vers, Southport, Globe strains.

Parsley: Dark Moss Curled.

Parsnip: Hollow Crown.

Peas: Hundredfold, Little Marvel,
Laxtonian, Telephone, World's Record.

Peppers: California Wonder, Ruby
King, Squash, World Beater.

(Continued on Page 10)

This Brand New POTATO DIP

Treats four times as many potatoes

Here is a brand new seed potato
treatment! It does away with old
"two hour" soaking. Gives better
disease control; produces more
consistent yield increases. And
time, labor and equipment consid-
ered, it costs you far less to use
than any other method. *One
pound treats 70 to 80 bushels
of seed!*

In 18 states, 62 miles of tests
have shown the increased economy
and effectiveness of New *Im-
proved Semesan Bel*. For as little
as 1½¢ per bushel of seed—even
less than the cost of corrosive
sublimite—*Improved Semesan
Bel* controls Rhizoctonia and scab.
In addition, it assures a more uni-
form stand of plants by preventing
seed decay.

Saves time in treating

With *Improved Semesan Bel*,
all you do is dip your seed potatoes
and plant. An easy, quick process

—10 to 30 times faster than old
soak methods—yet it provides all
the protection against disease
losses that the older seed treatment
can supply.

Yields increased 13 to 20%

Large acre yields are always
necessary to greatest growing prof-
its. Practical growers report that
they have obtained yield increases
ranging from 13% to 20% with
Improved Semesan Bel.

Treat all seed

Even certified seed often carries
disease organisms. That is why all
seed should be protected with
Improved Semesan Bel. You can
treat your seed for as little as
1½¢ a bushel, and even in very
small quantities the cost does not
exceed 3¢ a bushel. Ask your dealer
for new free pamphlet, or mail a
postcard today to Bayer-Semesan
Company, Inc., Dept. 60, 105
Hudson St., New York, N. Y.

CERTIFIED SEED POTATOES

IRISH COBBLER — CARMAN NO. 3
N. A. BAKER & SONS, FAIRPORT, NEW YORK

To every farmer who grows WHEAT

See how Chilean increases wheat yield. Shock at left fertilized with 3-12-6. Shock at right received 3-12-6 PLUS Chilean Nitrate at rate of 200 lbs. per acre. Some difference! Farm of George Brooks, Alexandria, O.

Here's A Profit Idea For You

EXTRA bushels per acre... that's what you need to make a profit. And the surest way to get extra bushels of wheat is to top dress with Chilean Nitrate of Soda. It supplies in quick-acting, efficient form, the nitrogen needed to strengthen the plants and push them ahead, just when plants need it most. Chilean increases your yield so much that it cuts down growing cost per bushel. It pays back its cost, then gives you real profit to show for your hard work and your investment in spite of the low market prices.

100 to 200 lbs. per acre... that's what you need. And it is just about the difference between a profit crop of wheat and the other kind.

The Natural Nitrate

Chilean, Nature's nitrate, is found only in Chile, where American capital mines and refines it. American ships and sailors bring in great cargoes for your use. Because of its natural origin, it contains those important "impurities"—Iodine, Boron, Magnesium, Potassium, Calcium. Each of these rare elements is a plant food in itself, adding its value to the nitrogen to make Chilean a super-nitrate... Nitrogen PLUS.

100 Lb. Bag: Low Price

Now packed in 100 lb. bags and improved in condition for your greater convenience. Low in price, too, for your greater economy. Chilean comes in two forms: the Original (Crystals), and Champion Brand (the pellet nitrate). Both are genuine Chilean Nitrate. See your dealer and insist on Chilean when you buy.

Chilean Nitrate of Soda EDUCATIONAL BUREAU

57 William Street, New York, N. Y.

FROSTPROOF CABBAGE and ONION PLANTS

My hardy field grown plants will mature heads three weeks earlier than home grown plants. Varieties: Jersey and Charleston Wakefield, Succession, Flat Dutch and Copenhagen Market. Onions: Prizetaker and Bermuda. Postpaid, 200 70c, 500 \$1.25, 1,000 \$2.00, Express collect 1,000 to 4,000 \$1.00 per 1,000; 5,000 to 9,000 90c per 1,000; 10,000 and over 75c per 1,000. Carefully packed, varieties labeled, delivery guaranteed.

P. D. FULWOOD, TIFTON, GEORGIA

(Continued from Page 9)

Pumpkin: Small Sugar, Cheese.
Radish: Scarlet Globe, Crimson Giant, Icicle.
Rhubarb: Victoria.
Rutabage: Long Island.
Salsify: Mammoth Sandwich Island.
Spinach: Bloomsdale Savoy, Long Standing Savoy, Virginia Savoy for late fall and wintered over crops.
Squash: (summer) Golden Summer Crookneck, Cocozello, White Bush, Scalloped; (winter) Boston Marrow, Warty Hubbard.
Sweet Potato: Yellow Jersey, Red Jersey.
Tomato: (early) Break-o-Day; (second early) Bonny Best, Marglobe; (late) Greater Baltimore, Matchless, Stone; (pink) Acme, Globe.
Turnip: (spring) Purple Top Strap Leaf, Purple Top Globe, Golden Ball, Aberdeen.
Watermelon: (long shaped) Klockley Sweet, Tom Watson, Excell; (round shaped) Coles Early.

How to Grow Asparagus

The home gardener should have at least fifty feet of asparagus. When you plant it, dig a trench 15 inches deep, put in four or five inches of well rotted (not straw) manure, packed solidly. On top of the manure put two or three inches of soil and then set the asparagus. Do not fill in the trench at once but fill in gradually as the asparagus grows. The trench may be leveled off by August 1. The standard distances for asparagus are 2 x 4 feet. Best success is had by planting the asparagus roots immediately after they are dug. It is a good idea to grow your own plants or at least to get ready and then have your nurseryman dig the plants while you are waiting so that they may be set at once. The Washington varieties are preferred.

Fertilize the asparagus bed with a fairly heavy coating of manure during the winter. In spring dig this manure into the ground when the bed is cultivated for the first time. If no manure is available, use one pound of Nitrate of Soda, one pound of Acid Phosphate and one-half pound of Muriate of Potash for every rod of row. Bone meal at the rate of two pounds per rod is also very good.

How to Grow Iceberg Lettuce

Few people know that the so-called Iceberg or Los Angeles lettuce that comes into our markets during the winter months from the Pacific coast states may be grown in the East with comparative ease. Do not buy the variety which the seedmen call Iceberg; buy the kind known as New York or Wonderful. Sow the seed as early in the spring as possible in a well-fertilized garden, thin to 12 inches, cultivate twice a week and by July 1st you will have some very high quality lettuce.

Advantages of Mulch Paper

The home gardener who does not like to hoe or weed his garden will rejoice at the advent of the new mulch paper. This paper comes in strips either 18 inches or 36 inches wide and is laid down at the time of planting the crop. It is held in place by stones or pegs. Its advantages are that it eliminates hoeing and weeding except in the row. It is also said to increase the temperature of the soil and thus enable the grower to produce earlier vegetables and to conserve moisture.

Higrade Frostproof CABBAGE PLANTS for early crops, \$1.50 1000—now ready. Prices other plants mailed. J. T. COUNCILL & SONS, Franklin, Va.

FARMERS PLANT CO., TIFTON, GEORGIA

95 Acres Of Hard Rocky Land And Not A Single Disk Chipped!

If you are thinking about buying a disk harrow or plow please read the following letter from Mr. B. F. Arthur, Winchester, Va.—
"We just wanted you to know that we have completed our third disking with the Clark 'Cutaway' Flexible Tractor Harrow and up to this time we have neither CRACKED, CHIPPED OR BENT IN ANY MANNER A SINGLE POINT on any one of the 24 disks. So your claim for special tempering process is absolutely justifiable. We have worked over some terribly rough rocky hilly soil covering in all about 95 to 100 acres and this machine has been terribly punished without a scar in a disk. The ground is unusually hard and dry now and we were compelled to put an inexperienced man on the tractor. Despite these obstacles the machine is STANDING THE STRAIN OF AN ARMY TANK!"

Clark Flexible Double "CUTAWAY" Action Harrow

Combines the most in flexibility with the utmost in efficiency. It does the greatest amount of work in the shortest time. Light draft. The front section can be used separately as rear section is detachable. The disks are made of cutlery steel heat treated and forged sharp. Forged edge disks, found only on Clark "Cutaways" won't crack or bend even when used on stony ground. They outlast 2 or 3 sets of other disks. Guaranteed for 3 years. Choice of cutout or solid disks same price. Clip coupon for FREE catalog which tells more about the Clark "Cutaway" Flexible Double Action Harrow, and other tillage implements. Valuable book, "The Soil and Its Tillage," also sent free.

Feeding the Soil

Physical Condition of Soil is Important

ACCORDING to Prof. F. B. Smith, Assistant Chief of Soils at Iowa State College, soils must be maintained in a high state of physical condition if profitable yields are to be secured. Soils breathe, and within reasonable limits he finds that the greater the respiration of the soil the more productive it is. The addition of barnyard manure, lime and organic matter are the surest ways of increasing the respiration of most soils. On soils which are puddled by working while too wet, undesirable gases are not

planting in the spring. On very rich soils acid phosphate alone may be sufficient.

When manure is not available, leaves, weeds, lawn clippings and the like may be used to supply the organic matter. They should be supplemented with three or four pounds of a high grade vegetable fertilizer for each hundred square feet.

Lime is sometimes necessary. Apply four to six pounds of ground limestone, or one-half as much hydrated lime, for each hundred square feet every three or four years if conditions warrant it. —Cornell Extension Service Handbook.

Fertilizer for Small Gardens

The amount of fertilizer needed for small plots, to give a certain amount per acre, is as follows:

Pounds Per Acre	Feet
100 equals one pound for a plot.....	10x43
200 equals one pound for a plot.....	10x21
300 equals one pound for a plot.....	10x14
400 equals one pound for a plot.....	10x11
500 equals one pound for a plot.....	10x 9
1,000 equals one pound for a plot.....	5x 9
2,000 equals one pound for a plot.....	5x 4½

allowed to escape and the soil may become choked. Farmers utilizing tractor power have an advantage in being able to keep off fields until the soil is in condition to work and then still have time to get their crops in the ground in good season.

The Value of Commercial Fertilizers

1. Fertilizers are used to balance the farm manure to supply the full needs of the plants.
2. Fertilizers reduce crop costs. Land rental, taxes, seed, and even labor are about the same whether the yield is high or low.
3. Fertilizers save feed bills by increasing the yields of silage and good hay.
4. Fertilizers increase soil humus by helping to grow more organic matter in the soil.
5. Fertilizers improve quality of all farm products where it is used.
6. Fertilizers are low in price this year and farmers may do well to catch up their needs a little while the price is reasonably low.

How to Manure the Home Garden

Manure at the rate of 10 to 20 tons an acre, supplemented by acid phosphate, is satisfactory for the home garden. Spade or plow under the manure, preferably in the fall, at the rate of 50 to 100 pounds a hundred square feet and work in two or three pounds of acid phosphate to the hundred square feet when the soil is prepared for

How to Use Poultry Manure

Poultry manure is a valuable fertilizing material containing on the average 1% of nitrogen, .8% of phosphoric acid and .4% of potash. To improve the mechanical state of the manure, sawdust scattered on the dropping boards will absorb moisture. The addition of superphosphate on the dropping boards at the rate of 40 or 50 pounds per 100 hens a week will help the mechanical condition and double the fertilizing value of the manure.

Poultry manure is best applied broadcast either prior to or after ploughing. A very light application can be applied in the row to vegetables, provided it is mixed with the soil previous to planting.

When to Apply Lime

Lime requires time to do its work. Six months, or better still one year, are needed when two tons of limestone have to be applied to clover. The more lime required, the more time should be given to the land. Lime should be thoroughly mixed with the soil. A top dressing of lime applied to growing wheat is of some help but not very effective to the new clover seed. We know of no way to get the top dressing of lime down into the ground without injuring the grain. Do not risk guessing the amount of lime you should apply. Free directions about obtaining soil samples and the actual test of soil may be obtained from any agricultural agent or the Department of Agronomy at the College of Agriculture at Ithaca, New York.

Lime Needs of Different Crops

High Lime Requirement

Alfalfa, Sweet clover, Red clover and White clover.
Kentucky Blue grass
Beets, cauliflower, onions, spinach and chard

Medium Lime Requirements

Alsike clover, Beans, Peas, Cowpeas, and Peanuts.
Barley, corn, wheat, and oats.
Timothy and Canada bluegrass.

Assure FULL VALUE for your FERTILIZER DOLLAR

Look for this tag

YOUR 1931 fertilizer dollar has to buy a full dollar's worth as never before.

It must buy a quality fertilizer that drills easily, evenly. A fertilizer that saves time, work, and helps cut crop costs to a minimum by assuring better yields of premium grade.

The certificate above is attached to every bag of Swift's Red Steer Fertilizers. It assures "Best Materials, Double-Mixed and Triple Tested." Fertilizer that is uniform, distributes evenly, economical to use, dependable in quality.

Look for this sign of your A. S. A.

Thousands of farmers now rely on this Certificate of Quality as their best buying guide to good fertilizer. Look for it on every bag of Swift's Red Steer. This year, can you afford to buy fertilizer any other way?

Here's another way to cut costs! Ask your Authorized Swift Agent about Red Steer high analysis, especially 8-24-8 or 8-16-14. Red Steer high analysis fertilizers give you your plant food for 10% to 15% less money.

Swift & Company
Fertilizer Works
Cleveland, O. Baltimore, Md.

SWIFT'S RED STEER FERTILIZERS

"IT PAYS TO USE THEM"

Here's What Your Neighbors Say About

Lowell Animal Fertilizers

UNSURPASSED—"For the past 17 years have used Lowell Animal Fertilizers . . . never had an unsatisfactory crop . . . had bumper crops, of good marketable quality . . . Lowell Fertilizers are UNSURPASSED in quality."

LOWEST COST—"The **LOWEST** Cost for fertilizer per barrel of potatoes harvested of any crop I ever raised."

EXTRA GOOD RESULTS—"Have used **LOWELL** Fertilizers for fifteen years with **EXTRA GOOD** results raising golden bantam corn and potatoes."

As they have, so may you profit! Resolve now to share in the 1931 profits. Have superior quality crops and extra yields that command top prices.

Built for Today's Farming

—To Stand the Unyielding Pull of Tractor Power

The steady, unflinching pull of tractor power has no risks for the John Deere-Syracuse Heavy-Duty Spring-Tooth Harrow—it's designed and built for tractor power.

Its spring-teeth—the business end of the harrow—are exceptionally strong, tough and resilient; made in special machinery to insure long life and efficient performance. These special-process, spring-steel teeth are held to the tooth-bars by heavy clamps—there are no bolt holes or notches in the teeth to weaken them.

Frames, clevises, draft-rods and runners are all similarly strong—the John Deere-Syracuse is uniformly and entirely a heavy-duty harrow designed for tractor power.

See it at Your
John Deere Dealer's

Your John Deere dealer wants to point out to you all the fine features of the John Deere-Syracuse that make it the ideal harrow for tractor power. See it at his store. Write to John Deere, Moline, Ill., for free folder MD-91

There's a Heavy-Duty Weed Destroyer, Too!

The same heavy-duty features of design and construction that are found in the heavy-duty harrow are used in the John Deere-Syracuse Heavy-Duty Weed Destroyer. It has fewer teeth to the section to provide greater space for trash to clear. It's the ideal equipment for the power-farmer who has weed-infested fields.

It Pays to Drain

Land, otherwise good that has a low agricultural value because of inadequate drainage.

Soil that is so wet and cold in the spring that seed bed preparation is hindered and seeding delayed.

Soil that does not dry quickly enough after rains to permit adequate cultivation of the growing crop.

Land where crop injury is due to excess water in wet seasons, or to drought in the late summer or fall, as a result of a shallow root system caused by poor drainage earlier in the season.

Small wet areas in fields that are otherwise well drained.

How to Grow Soy-Beans

Soy-beans are hot weather plants and it is not advisable to plant before June. The rate of seeding depends upon method of planting. If planted as a row crop, they should be drilled 5 pecks to the acre. When broadcast, the amount varies greatly.

Soy-beans are legumes and in fertile ground, results can be secured by using super-phosphate, though a small application of commercial fertilizer will probably be profitable. Care should be taken in applying the fertilizer since the seed of legumes are injured by direct contact. Manchu and Black Eyebrow are recommended varieties for New York State.

MORE PROFIT WITH

LOUDEN

With the A. A. DAIRYMAN

(Continued from Page 4)

quarters, it is a good plan to white-wash the pen, or disinfect it with a good stock dip solution before the calves are put in.

Sunlight is also necessary for young calves. In warm weather it is well to have a small outdoor lot or yard in which they can run. In cold weather, they should be kept in a pen which has plenty of windows, as the sunlight keeps the pen dry and warm.

When the flies are bad, it is well worth while to spray young calves with a good fly spray.

Keep the feeding pails and troughs clean. During the period that milk is fed, the pails should be scrubbed with hot water after feeding, and set out in the sun during the day.

Control of Cattle Lice

Cattle lice may be of three kinds, all of which are combatted in the same manner. Clipping the hair, feeding, and good nutritious food are great helps in controlling lice. Lice powders are helpful, if the weather is too cold for dipping. A mixture of equal parts

How to Grow Green Feed for Cows All Summer

When to Plant	What to Plant	Rate to Plant (Acre)
Early	Oats and Peas	1 bu. peas 2 bu. oats
Up to corn planting time	Oats alone	3 bushels
At corn planting time	Soybeans—medium early green or Wilson	Drilled at 90 pounds
Just after corn planting time	Early Amber Sorghum	Drilled broadcast 40 pounds
A week later	Sudan grass	Drilled broadcast 25 pounds
Week after Sudan	Japanese Millet or German Millet	Drilled broadcast, ½ bushel
Latest, but before July 15	Common Millet	Drilled broadcast, ½ bushel

of lard, kerosene and sulphur may be applied by hand to a limited number of animals.

One pound of larkspur seed, 1½ gallons water boiled down to one gallon makes an efficient spray.

Ten ounces of vinegar added to coal tar dips will make them more satisfactory. It is well to rub in with a brush after spraying.

One treatment will not usually suffice, and it is best to repeat weekly until cured.

How to Fit Calves for the Show Ring

Weeks before the show, begin to train your calf daily by leading her around with a halter. Just walk it around the lot a few times a day. Anything will do, just so you start in time. Then teach it to stand. Practice standing it with all four feet squarely under it. Back it up. Lead it forward. Do anything to gradually teach it to move when you want it to move, and stand still when you want it to stand.

After it becomes halter-broke, teach it to stand. It should have all four feet placed squarely beneath it when in proper position.

Blanketing is also important. Begin to blanket your calf several weeks before the show to mellow the hide and to make the hair lie smooth and sleek.

It is seldom advisable to clip very young calves, except over the head, ears and tail. Older heifers that may have become shaggy and rough may be clipped all over several weeks before the show, so that the hair will have time to grow out evenly before show

(Continued on Page 14)

The Lesson of the Drouth points to Spreaders

MANURE

is worth real money these days. Gardeners used to get \$1.50 per horse for hauling manure away from city stables. Now they pay as much as \$7.00 per horse for the privilege, and can't get enough.

McCormick-Deering Manure Spreaders

THE NEW LIME SPREADING ATTACHMENT

doubles the usefulness of the McCormick-Deering spreader. It is an easily-attached unit that enables you to treat sour soils to increase yields and profits at very low cost. Tell the McCormick-Deering dealer to point out the other features offered by the McCormick-Deering Manure Spreader. Ask for a demonstration.

The McCORMICK Reaper Centennial

AFTER last summer's drouth there were many fields in the "50 per cent crop" sections that produced yields pretty close to normal. The reason could often be found in soil fertility—in the fact that decaying organic matter absorbs and holds moisture.

The manure spreader is the key machine in good farming wherever livestock is fed. Used regularly to conserve all the elements of fertility, it is the one best insurance policy against bad weather such as that of the past summer.

It may be dry again this summer. Build up the humus of your soil to forestall such a condition. And do it easily, quickly, and pleasantly with a McCormick-Deering Spreader sold by the McCormick-Deering dealer in your town. Write for a folder.

time. Curry and brush down daily. Never wash solid-colored calves, as it takes the oil out of the skin and hair. But with spotted or white calves washing is necessary to make them clean for showing.

The horns should be filed to the desired shape, then smoothed with a scraper, and finished with emery paper. To get a real high polish, rub them down with oil and pumice stone.

Just before leading the animal into the ring, wipe down with a wet rag to which a few drops of linseed oil have been added, and finish off with a hand rub.

Show your calf every minute you're in the ring. Keep it square on its feet with its head up. Lead it around and keep it alert. Be alert yourself. This all helps to make a good appearance before the judge. All these things help to make a champion—the kind you want, the kind you must have in the ring.

Care of Fresh Cows

Warm drinking water for a few days, if very cold weather, so as not to chill cow, as she is always feverish at this time.

2. Feed bran mashes for two or three days, then start with small grain ration.

3. When udder is normal, increase ration gradually, about one pound every other day until maximum milk flow is reached.

4. Then reduce feed slightly and continue feeding according to her production.

Retention of After-Birth

Retained after-birth frequently follows under-feeding. Well-fed cows usually do not give much trouble. It is sometimes associated with contagious abortion. Keep the cow warm and give a warm bran mash after calving. Sometimes a physic is desirable. If the after-birth does not come away in 48 hours a veterinary or other experienced person should be called.

How to Prevent the Growth of Horns

Before the calf is one week old, the hair should be clipped from the little bump or horn button where the horn starts. Rub some vaseline in a circle around the horn button, then rub the button with a stick of caustic potash until a spot about the size of a dime is red but not bloody. Put the potash only on the horn button. Don't use too much as it may spread and injure the calf. Don't turn the calf out in the rain immediately after putting on the potash as the rain will wash the potash into the calf's eyes.

Keep the caustic potash, which may be secured at any drug store, in a tightly corked bottle when not in use and do not handle it with your bare hands.

How to Register Pure-Bred Calves

First, write to your breed association and ask for application blanks and information. They will send you some blanks for all the information about your calf, its sex, color markings, birth date, name of sire and dam, etc.

Fill out these applications just as the directions call for, and return them with the registration fee (which amounts to about \$2) and they will send you the certificate of registry. That is all you need to do to get the papers on your calf.

If you sell the calf to someone and he wants to have the papers transferred to him, then you must put through a "transfer." The breed association has

water supplied to them by the poultry.

"RIB-STONE" highly praised by all"

Says Monroe County Farmer...

Rib-Stone Concrete Corp.

I want to go on record as stating that I have got an exceptionally good job both from workmanship and the material standpoint. Needless to say the silo has been highly praised by all who have examined it. (Signed) L. A. Wehle

Letters like this are received frequently. Farmers praise the rock-like construction of Rib-Stone concrete silos. Every stave, moulded to a patented shape which gives greatest rigidity is reinforced, wet-cast and perfectly cured. Heavily galvanized steel hoops bind the staves into a silo that stands firm as Gibraltar. Years roll by and Rib-Stone Silos still give perfect protection to the ensilage.

Iron clad ten year guarantee for every Rib-Stone Silo

2 interesting FREE Silo Booklets

packed full of useful information about silos and farm problems. These booklets were especially prepared for farmers who contemplate the purchase of a silo. Write for them—they are free to farmers.

If Your Cows Had Money to Spend—

WHAT would they buy? Shoes, candy, new hats? No! Every last one of them would trot down to the feed store for Dried Molasses Beet Pulp.

They know it's good—that it is bulky and palatable—that it is not only highly digestible itself but that it aids the digestion of the entire ration. Most important of all they know that Dried Molasses Beet Pulp increases the flow of milk.

And being of the gentler sex they know a bargain when they see it—prices are lowest in ten years.

Don't pay a fancy price for hay—six pounds of Beet Pulp will do the work of ten pounds of hay and do it better. Don't worry if your silage is getting low, Beet Pulp is even better than silage. See your feed dealer without delay. Shipments made direct from factory nearest to buyer.

What is left in a silo after part has been used can be estimated as follows: Find original amount of silage put in silo by referring to table. Find amount of silage that has been used by same method, using as depth the difference between present depth and depth two days after filling. Subtract amount used from original amount. The difference is approximate amount of silage remaining in silo.

—Cornell.

Gardening, dairy, and poultry were the "big three" 4-H agricultural projects in New Hampshire in 1930. Gardening enrollment totalled 1,109 and net labor income \$18,698.81. Dairy enrollment numbered 360 young people, with a net labor income of \$15,135, much of which is represented by young stock. The 368 poultry-club members realized a labor income of \$13,229.

3 . . . Kinds of . . . De Laval . . . Milkers a size and style for every . . . need and purse . . .

NO MATTER what your milking requirements may be or how many cows you have, there is a De Laval Milker which will serve you better and give you more profit and satisfaction than any other method of milking.

De Laval Magnetic

The world's greatest milker—does better work than any other. The ideal milker for the great mass of users. Thousands of outfits in use in all parts of the world. Pulsations controlled by magnetic force insure absolute uniformity of milking. Cows always milked the same way and produce to their greatest ability with Magnetic milking. Any one can operate it. Easy to handle and care for and keep in a sanitary condition. Operated by gas engine or electricity. Outfits for milking one to 500 or more cows.

De Laval Magnetic Combine

The latest development in milking. Milks just like the Magnetic but in addition automatically weighs and conveys the milk. Cows are milked in a milking room or "parlor." One operator milks 30 to 40 cows per hour with this system. Milk is drawn into a visible glass holder, where it is weighed, then passed through sanitary pipes into the milk bottling room. The shortest route from cow to bottle. Milk never comes in contact with hands or other sources of contamination. Extremely sanitary. The ideal milker for producers of certified or commercial market milk. Outfits in use in finest dairies of the country.

De Laval Utility Outfits \$145.00 and Up

The best low-priced milker made. Ideal for the small dairyman or for those to whom price is an essential consideration. Does better work than any milker in its class. Many outfits in use in all parts of the country. Furnished with single or double units, which can also be used with any make of single pipe line milker. Outfits for milking one to 40 cows.

See your De Laval dealer or write nearest office below and we will gladly assist, without obligating you in any way, in working out the best milking system for your needs.

not so marked as during the week previous. In general the undertone has been much firmer and sentiment has improved. Butter receipts have been heavy in New York City but a very satisfactory consumptive demand has absorbed these heavy receipts, keeping the market healthy. Retail stores are continuing to hold prices down close to the wholesale level and as a result the volume of butter going into the distributing channels has been running steadily ahead of the same period a year ago. In spite of this better condition, the market still rests in the buyer's favor. The great volume of butter that is being made at the present time is responsible for the situation. Just as soon as buyers balk and hold off, stocks pile up and a critical situation results.

Monday, February 23, being a holiday found the market with considerable surplus piling up, causing prices to break Tuesday morning under increased pressure to sell. The cut was too extreme and some recovery was experienced on Wednesday. The situation improved Thursday and held on Friday. However, on Saturday, the day of our quotation, demand slackened and the market closed quiet and slightly easier. There was any amount of butter available at the quoted prices and therefore we expect no pronounced change.

Withdrawals of butter from storage are still running ahead of those of a year ago. From February 20 to February 27 the four principal markets reported an out-of-storage movement of 1,367,463 pounds compared with 915,433 pounds moved out during the same period last year. On February 27 the four cities held 14,403,430 pounds of butter compared with holdings on the same day a year ago totaling 18,358,356 pounds.

Cheese a Shade Easier

STATE FLATS	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Fresh Fancy	17-18	17 -18	18 1/2-
Fresh Average			
Held Fancy	21-22 1/2	21 1/2-22 1/2	24 -26
Held Average			23 -

The cheese market was well supplied with stocks during the last week in Feb-

ruary and round lots are being offered at slightly lower prices than quoted. Business at a whole is very dull and there is nothing to report of any consequence. Unfortunately there is nothing encouraging and it looks as though the trend is just a shade downward. On February 26 the ten cities held 11,294,000 pounds of cheese, whereas on the same day a year ago the same cities held 13,739,000 pounds.

Nearby Eggs Close Firmer

NEARBY WHITE	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Hennery			
Selected Extras	24 1/2-25 1/2	23 1/2-25	31 -
Average Extras	-23 1/2	22 -22 1/2	29 -
Extra Firsts	22 1/2-23	21 -21 1/2	
Firsts	21 1/2-22	20 -20 1/2	
Undergrades			
Pullets			
Pewees			
NEARBY BROWNS	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Hennery	23 -25	21 -23 1/2	30 1/2-31 1/2
Gathered	20 -22 1/2	18 -20 1/4	-29 1/2

As the market came to a close during the last days of February, nearby eggs were showing a little improvement. However, there was nothing to get excited about. Nearby producers have been running into the stiffest kind of competition. First they have had to meet the challenge of Western producers. On top of that many eggs of late have been sold by retailers at a considerable loss as an advertising medium to attract trade. In addition, practically no nearby eggs are being stored, the great bulk of the receipts being pushed for immediate sale.

The immediate outlook shows no improvement but the long time outlook takes on a better light. Prospects are for a relatively light early hatch. Furthermore, there has been a heavy marketing of birds in the West. The activity in the future market and a summary of statistical facts indicate that fresh egg production next fall and winter will be lighter than during the past season. Many speculators are sending stock into the "Chambers of Hope" at prices considerably above what many dealers think safe.

Leghorn Fowls Sell Well

FOWLS	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Colored	20-21	-25	-35
Leghorn	17-21	23-24	-35
CHICKENS	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Colored	24-29	24-28	28-32
Leghorn	21-23	21-22	28-32
BROILERS	Feb. 28, 1931	Feb. 21, 1931	March 1, 1930
Colored	30-38		37-45
Leghorn	35-38		-37
OLD ROOSTERS	15-16	15-17	-19
CAPONS	38-42	37-40	35-42
TURKEYS	30-40	30-40	30-42
DUCKS, Nearby	24-27	25-28	24-26
GESE	18-20	19-20	18-20

Leghorn fowls have been in excellent demand while colored fowls have exper-

enced a slow market that has failed to respond to any kind of stimulant. Fancy Leghorns have sold readily at 21c while it has been difficult to realize this price for even the choicest colored stock. Chickens and pullets have been so scarce that there has been hardly enough sales to justify quotations. Broilers finished up the week in a less satisfactory position. During the early days of the week they were holding firm, but just before the close there were free arrivals which failed to clear and values fell steadily. Hen turkeys have been in demand right along. Capons and ducks have also cleared promptly.

On the lower part of this page is a schedule of the holidays during 1931, when live poultry will be in demand. It is advisable to hold this schedule for future reference. It should be borne in mind that at these holiday times only fancy poultry is wanted. Also observe the best days for marketing. Shipments should be timed so that they arrive in the market on the best marketing days.

Hay Market in Better Shape

The hay market is in better shape. Although business was not particularly good during the last week in February, nevertheless the trade closed steady on the 28th. The heavy accumulation of low grade hay from Canada is being reduced steadily and the market is working into better shape. Straight timothy is now bringing from \$27 to \$29 with lower grades and mixtures proportionately lower.

Bean Market Easier

Practically all varieties of beans have shown further weakness. Domestic goods are better off than imports. Jumbo Marrows bring from \$5.75 to \$6.25. Pea beans bring the same price as average Marrows, namely \$4.75 to \$5.25. Red Kidneys generally sell above \$9, the range being \$9 to \$9.75. White Kidneys average \$7 selling over a range of \$6.75 to \$7.35. Round Cranberries bring anywhere from \$5.75 to \$6.50.

The apple market is showing some improvement of late. The weather has been more favorable and trade more active on good to fancy stock of the favored varieties, averaging a shade higher in some instances. McIntosh have been bringing from \$3 to \$6.50 per barrel, others down as low as \$3. Baldwins, Greenings and Rome Beauties sell over a range of \$2.50 to \$5.50. Northern Spy sell anywhere from \$2.50 to \$6. Practically all the other varieties bring anywhere from \$2.50 to \$5.

Feast of Law	Oct. 4	Oct. 1-2	Prime quality live poultry of all kinds.
Thanksgiving Day	Nov. 26	Nov. 21-23-24	Live turkeys, fowl, capons, ducks, geese, also squabs and pigeons
Christmas Day	Dec. 25	Dec. 21-22-23	Live turkeys, broilers, capons, rabbits, fowl, chickens, ducks, geese, squabs and pigeons
New Year	Jan. 1, 1932	Dec. 28-29-30	Live hen turkeys, broilers, capons, rabbits, fowl, geese, ducks, squabs and pigeons

Shippers should note these dates carefully and time shipments to arrive on the best market days.

Farm News from New York

E. R. Eastman Appointed Federal Land Bank Director

AN announcement of great interest to our readers is one just made by E. H. Thomson, president of the Federal Land Bank of Springfield, Mass. to the effect that Edward R. Eastman, editor of American Agriculturist, has been appointed director-at-large of the Federal Land Bank of Springfield. Mr. Eastman will fill the unexpired term made vacant by the resignation of Dr. George F. Warren of Cornell University. In the nomination and election held by the national farm loan associations of the first Federal land bank district, consisting of New York, New England and New Jersey, "Editor Ed" received the highest number of votes.

"Mr. Eastman's contacts with the farmers of New York, New England and New Jersey, through his paper, will be valuable to the bank and to him in his new position," said Mr. Thomson. "He has a background of accomplishment which also will prove valuable in his work as a director-at-large."

Mr. Eastman's work as director of the Federal Land Bank will in no way interfere with his work as Editor of American Agriculturist. In fact, it is confidently expected that his position as director of the Land Bank will enable him to be of still greater service to eastern agriculture.

Herbert E. Cook

FRIENDS of Dean Herbert E. Cook of Denmark, New York, were immeasurably shocked to hear of his death at his home on Sunday morning, February 22. Few indeed, are the farmers of New York who did not know Dean Cook, either personally or through his writings. His "Plow Handle Talks" in American Agriculturist were for a great many years one of the first things in the paper to which thousands turned when the A.A. came, and those who were privileged to hear Dean Cook's talks in Farm Institutes or at Grange meetings will never forget his kindly humor or his practical common sense.

None will miss his more, either, than the hundreds of boys who sat at his feet to learn the theory and science of agriculture while he was Dean of the State School of Agriculture at St. Lawrence University. He assumed the head of the school in 1907 and continued there for nine years, after which he returned to his farm to make it one of the leading certified milk producing farms in the north country. He was one of the pioneer producers of certified milk, starting the business with his son-in-law in 1902.

H. E. Cook was born in 1858 in the town of Denmark where he always lived. He knew butter and cheese making from practical first-hand experience in a factory on his farm. For fifteen years he was farm institute lecturer and conductor, speaking in hundreds of farm communities throughout the state, and was one of the last fine old-time institute lecturers.

We are proud that the mast-head of American Agriculturist was able to carry the name of H. E. Cook as a member of our staff for many years. Places of these older men who laid the foundations for modern scientific agriculture are going to be hard to fill. In common with all of his legion of friends, we shall miss him, not only as a co-worker in the cause of agriculture, but as a friend.

He is survived by his widow, his daughter, Mrs. Walter H. Blodgett, and two grandchildren. To these bereaved ones we extend our sympathy.

The National Dairy Improvement Program

THE National Dairy Association and the American Dairy Science Association are again sponsoring what is known as a National Dairy Improvement Program.

Briefly, the country has been divided into five regions and the county agents who wish to compete will submit through their own State College of

Agriculture a county dairy improvement program. The agent in each section who submits the best program will win a free trip to the National Dairy Show next fall. New York State is entering this contest.

The object of the contest is to encourage the development of the type of educational dairy improvement programs that are best adapted to New York State agriculture. Any Farm Bureau which has an organized dairy improvement project committee is eligible to enter the contest. All programs must be in July 1, 1931.

The winning county agent and the dairy committee chairman in the county which wins the New York contest will be awarded one hundred dollars each toward a trip to the National Dairy Show. The winner in the New York State contest will be entered in District No. 1, of the national contest.

Some Personal Marketing Experiences

THE other day we secured some convincing evidence in the form of personal experiences of a Long Island farmer who has tried the idea of giving the consumer what he wants.

For several years this man has been growing strawberries and has packed them so attractively that consumers in Brooklyn have come to prefer his stuff. As a result, he secured a nice premium over the market price. A neighbor who wanted to keep his help busy during the slack season, decided to try it too, but was surprised when he made his first shipment to find that his returns were way below his neighbor's. Here was a fine chance for him to conclude that all commission merchants were crooked. Instead of doing that he took a crate, like those he had sent to the city, to his neighbor and said: "You

get better prices than I do. Here is a crate as I shipped it. What's wrong with it?"

Suggestions were given as one good neighbor to another. They were followed and the next shipment secured much better returns. Giving the consumer

A. A. Radio News Over Station WHAM

ON March 2, radio station WHAM of Rochester began broadcasting a new feature of particular interest to farm listeners. Each Monday, Wednesday and Friday from 12:10 to 12:15 P. M., farm news prepared by the editorial staff of A. A. will be presented, and at the same time on the other days of the week an editorial, in which E. R. Eastman, editor of A. A., discusses some problem of importance to eastern agriculture, will be given.

We suggest that you tune in on WHAM each day from 12:10 to 12:15.

what he wants is not all one-sided because the consumer is perfectly willing to pay for it.

Another little incident is very convincing. Just as an experiment, our farmer friend, who grows a considerable amount of sweet corn, sent in one shipment in berry crates instead of boxes and with a red asparagus tape around every twelve ears. He had no idea as to whether or not it would pay and was rather surprised on getting returns to find that this little extra touch made a big difference in his returns. He was interested enough to inquire into the matter farther. The commission man told him that the grocers were very anxious to buy corn in this way because, in a sense, it prevented the housewife from handling every in-

dividual ear and pulling down the husk to see whether it was good or not. In this case the groceryman might have been the deciding factor, but, in the long run, it is possible that the consumer really got better corn. Examination of a particular ear of corn by six different people does not add to its quality.

Then again, this same man has tried a radical experiment in the selling of his potatoes. He has followed the lead of some of the Western growers in selling potatoes for baking put up twenty in a box, each individually wrapped. We can just hear some of our potato growing friends laughing at all this foolishness. Perhaps it is foolishness but, nevertheless, it pays. The ones sold for baking were not extra large potatoes, but were absolutely uniform in size and shape. Perhaps only a half bushel of these were picked out from among twenty bushels of potatoes. As a result, those that remained were not culls, but the big premium received for the baking potatoes did increase the average price per bushel received by the grocer.

The rest of the potatoes sold were also closely graded. It so happened this year, that our friend had a good supply of white string on hand and used this to tie up the sacks. One day he was in his commission man's place of business in Brooklyn, talking about the quality of the stuff he was shipping, when a buyer came into the store asking for Long Island potatoes. He was shown some, but said he did not want them. The commission man asked him what was the matter and he said: "Well, they are all right, but I want some of those that are tied up with the white string." This buyer had recognized quality because the consumers to whom he sold recognized it. What would happen if all Long Island growers would grade as rigidly? You know the answer without our telling it to you.

New York County Notes

Steuben County—There is still plenty of snow up here in this county. Everything is very dull. Potatoes are 60 to 65 cents. There is some talk of drilling for gas. One farm has gas now from a well down 2900 feet. Some are anxious to get more leases but nothing definite about more drilling for gas. Some farms not yet leased. No snow has been removed except from the improved roads, and in some places it is removed so that no snow is left for sleighs. There has been more snow this winter than in several years. Most all travel on the hills is in the fields and one farm has been closed to travel by the family on the farm, and the road is full of snow.—D. C. F.

Potter County—Heavy snow is found in central parts of the county. Only a few inches in northern part. Weather mild and local papers report the presence of robins and bluebirds. Surveying of routes for new State roads is progressing. The unemployment situation still bad. Routine work is in order on the farm, cutting fenceposts, getting wood etc. Farmers having sugar bushes are preparing to tap. Local prices: Eggs, 22½ to 25 cents; pigs, \$3.00; cheese, 15 cents; potatoes, 85 cents.—M. C. S.

Cattaraugus County—Miss Althea Aust, a senior in the Home Economics Department, Cornell University, and a Cattaraugus County girl, has been awarded the Bridgen scholarship given annually to the most worthy extension student enrolled; her father, the late A. P. Aust, was for many years president of the county Farm Bureau.

The Farm Bureau, through C. G. Bradt of the Animal Husbandry Department at Cornell, is offering a special service to dairymen who have surplus cows and young stock for sale. They are compiling a list of all TB tested, well bred and grown stock having good production records that are for sale. When such list is completed, it will enable dairymen in other parts of the State to purchase animals to

replenish their herds instead of looking to the West. Mr. Bradt will keep on file at all times similar lists from all counties having stock for sale.

The farm inventory is completed in the county. More farmers each year are doing this valuable service to themselves and their farm for business reasons.

Dr. Birch and Dr. Thompson of the State Veterinary College conducted an important meeting in Ellicottville at the farm of J. F. Crowley, president of the Farm Bureau. Mr. Crowley started blood tests in his herd for contagious abortion early in 1929. The progress made in cleaning up this very serious disease of cattle by the blood tests was shown at Tuesday's meeting.—M. M. S.

Western New York—The first of the week of February 16 there was a real thaw with some rain. By the 19th it began to seem like sugar weather and an occasional optimistic sugar-maker tapped, but it turned much colder over night, so the run of sap amounted to very little. It seldom pays to tap quite so early unless the sugar bush is a very big one. In that case, even though each tree runs only a little all together it is enough to amount to something, and extra early syrup and sugar of course command an extra price.

It really seems that the backbone of winter is broken and spring not so very far off. A few crows are cawing over toward the woods and a small flock of starlings just alighted in an apple tree outside the window. However, a warm March with winter weather again in April, as sometimes happens, is not to be desired.

Colds are prevalent owing to which school attendance in some instances has at times dropped nearly 50 per cent.

Egg prices have kept at the same low level for about a month. Large white henner eggs sell on the Buffalo market at 22 cents; medium at 18 cents. It is rumored that butter prices are scheduled for a rise.

DAIRYLEA

Dried Skim Milk

A Quality Product For Poultry, Calves, Pigs

DAIRYLEA Dried Skim Milk in poultry rations, insures growth and health. Strongly recommended by feeding authorities. The ideal food for growing chicks. Increases egg production and improves hatchability in layers and breeders. Also excellent for calves and pigs.

Manufactured in plants of the Dairymen's League Cooperative Association, Inc. from the same high quality milk that is approved for New York City. Guaranteed by years of careful laboratory analysis and experiment.

Carried by local feed dealers and feed stores. If there is no representative in your town, order direct from New York office.

Packed in 100 lb. bags and 150 lb. Barrels

Fill out coupon and mail today A.A.

Dairymen's League Cooperative Association, Inc.
Room 2140, 11 West 42nd St., New York City

Begin your cost-cutting in the machine shed

This is the year to keep your eye on farm costs. Profits in 1931 will depend on how much you are able to cut costs. Spend a few weeks in the machine shed now. Have your

tractor, plows, seeders and cultivators all tuned up *before the season starts*. Clean off all the old grease, dust and dirt. Start with fresh lubricants throughout.

Lengthened life for spreader—Lubricate beater bearings with Mobilgrease every day. Brush it on chains and sprockets, too. Use Mobiloil "CW" in regular oil holes.

Avoid bearing wear—If you hook up a wood saw to your tractor, be sure the shaft bearings are well-lubricated with Mobilgrease. It won't throw off and leave bearings unprotected.

Stationary tractor warning—In stationary work it's important to keep up the crankcase level with the right grade of Mobiloil for your machine. Also, the transmission is likely to be seriously damaged unless properly lubricated. Use Mobiloil "CW" in cold weather.

Careful attention here—Several bearings in feed grinders and corn shellers operate at high speeds, under heavy pressure. Use Mobilgrease every day to avoid bearing replacements and power losses. Use Voculubricant in grease cups and Mobiloil "CW" in your hand oil can.

Lay in a season's supply of these new cost-cutting lubricants

Mobilgrease—for pressure fittings and upright grease cups. Lasts twice as long as other greases. Creeps quickly to friction points and sticks there. Won't squeeze out. Rain will not wash it away.

Voculubricant—Ideal for grease cups. Flows readily to bearings even in chilly

weather. Will not cake or dry out. Mobiloil "CW"—Essential for gears and transmissions. The most efficient hand oil can lubricant you can find.

The complete Mobiloil chart at your dealer's shows what grade of Mobiloil to use for tractor crankcase and transmission.

Mobiloil stands up

Because it is Made — Not Found

VACUUM OIL COMPANY

With the A. A.

Farm Mechanic

How to Overhaul the Tractor

If possible, the crankcase of the tractor should be removed and thoroughly cleaned of all sludge and caked oil. Bearings may then be examined for condition, and necessary replacements made. Modern construction often prohibits tightening of connecting rod bearings and therefore necessitates entire replacement of the rod.

The oil filter should be thoroughly cleaned out and the element renewed. The air filter, whether of the dry or the wet type, will need a thorough cleaning. Magneto breaker points should be smoothed with a contact file

when only a few lights are in use at a time.

When power is needed, however, this combination plant also provides an ideal electric service, direct from the generator. When this current is being taken from the plant, it goes direct from the generator and not through the battery. Whenever a motor, an electric iron or other similar appliance is turned on, the generator automatically starts. The result is that all heavy loads are automatically taken care of direct from the generator itself. While the plant is furnishing current for power, there is a surplus being generated which goes into the battery as a trickle charge, keeping the battery in perfect condition for supplying lighting service.

Proper Proportions for Concrete

	Cement	Sand	Gravel or Crushed Rock
Foundations	1	2	4
Floors (Poultry House)	1	2 1/2	5
Floors (Feeding)	1	2	4
Walks	1	2	4
Water Troughs	1	2	4
Fence Posts	1	2	3

Note—Sand and gravel should be clean. Dirt reduces the strength of concrete. Crushed rock for fence posts should not be over 3/4 in. in diameter.

or, if badly pitted, replaced. Readjustments of points to the opening recommended in the tractor instruction book should follow. Clean and adjust spark plugs and replace plugs that are badly pitted. Worn plugs, even though they may fire the charge, are wasteful of power and their replacement is good economy.

Frequently it is advisable to remove the front wheels, wash the bearings with kerosene, replace the felt packing washers, and re-pack with new grease. The transmission units also will be benefitted by draining out the grease, flushing with kerosene, and refilling with new lubricant.

Types of Electric Plants

Automatic Plant—provides current whenever electric needs are in sufficient quantity to make operation of the engine economical. This type has no batteries. The engine starts as soon as the current is turned on.

Battery Charging Plant—provides current at a low cost where electric needs are generally at a normal level. Only the amount of current needed is taken from the batteries without expense of running the engine and providing more electricity than is actually used.

Combination Plant—in most electrically equipped homes the current required for lights is, comparatively

Usual Current Consumption of Electric Appliances

1 rod in length	1	2	3
100 rods in length	100	200	300

small. A great part of the time, the few lights used about the farm make only small current requirements. For this type of limited usage, it is a well recognized fact that current direct from the storage battery is most economical. For a few lights, the combination plant provides storage battery service, overcoming the higher operating cost of an automatic plant

amount of water for slacking and an after addition of water to bring it to a brush consistency.

Weatherproof Whitewash (Exteriors)—For buildings, fences, etc.

(1) Sixty-two pounds (1 bushel) quicklime, slack with 12 gallons of hot water.

(2) Two pounds common table salt. 1 pound sulphate of zinc, dissolve in 2 gallons of boiling water.

(3) Two gallons skimmed milk. Pour (2) into (1) then add the milk (3) and mix thoroughly.

Note: Alum added to a lime white wash prevents it rubbing off. An ounce to the gallon is sufficient. Flour paste answers the same purpose, but needs
(Continued on Page 29)

Hints for Increasing Poultry Profits

How Many Baby Chicks?

Poultrymen without exception are debating as to the number of baby chicks they should buy this spring. Here are a few facts and figures which may help in reaching the right decision.

Last year there was a slight increase in the number of baby chicks hatched. In studying figures for the last ten years, we find that the biggest decrease in any one year, as compared with the previous year, was 5 per cent. If we were in the habit of predicting, we

Approximate Daily Amounts of Grain to Feed 100 Laying Hens

(Average weight of hens 4 pounds)

Month	Morning feeding (pounds)	Night feeding (pounds)
November	3	10
December	3	10
January	3	10
February	3	10
March	2	10
April	2	10
May	2	10
June	2	10
July	No	11
August	morning	10
September	feed	9
October		9

—Cornell Bulletin 45

would maintain that when the final figures are in, there will be at least 90 per cent as many chicks hatched this year as last year.

We have talked with a number of poultrymen and almost without exception the commercial poultrymen or the general farmers who have been making fair returns from their poultry plan to

poultry business, last year and not this year was the time to do it."

A good rule to follow is to be conservative when the other fellow is optimistic, and to be optimistic when he is blue.

Monthly Hints For Poultrymen

March

As a result of experiments recently completed at Cornell University, the Cornell chick ration and system of feeding have been revised. The changes make for better growth and healthier chicks. The idea of simplicity has also been kept in mind in making these revisions in order to make chick rearing easier. (You will find the Cornell chick ration in this issue).

April

1. Start chicks on clean ground. This will avoid trouble from range paralysis, intestinal worms and coccidiosis.
2. Use shavings or fine cut wheat straw for litter. Be sure that litter is not moldy.
3. Inspect the brooder stove twice a day to see that it is working properly. As the chicks grow reduce the amount of heat and see that the brooder houses are well ventilated on warm nights.

May

1. Provide plenty of clean, wholesome feed and water.
2. If possible allow them to range on grass, clover or alfalfa sod where chickens have not run for several years.
3. Provide shade for growing pullets.
4. Provide plenty of roosting space

old hens to maintain summer production. Moisten the regular dry mash with skim milk or water and feed 4 to 6 quarts to each 100 hens. Feed late in the afternoon.

2. Feed little or no scratch grain in the morning. Give from 8 to 9 pounds per hundred hens at night.

3. Cull out and sell all hens that fail to respond to good feeding and management.

August

1. If you are building a new poultry house this is a good month to do it.
2. Keep the pullets growing.
3. Sell hens that stop producing this month.

September

1. Put pullets that show comb de-

and fresh green feed to insure good hatchability.

4. Use pedigreed males in your breeding pen for increased production.

February

1. Overhaul the hatching and brooding equipment.
2. Clean and disinfect brooder houses.
3. If hens are laying thin-shelled eggs supply them with oyster shells and cod liver oil.

Choosing the Electric Brooder

1. Insulation:

Insulation is any material which prevents or retards heat passing through it. When buying an electric

Details of An Efficient Electric Brooder

velopment into laying houses. Discard weaklings and cripples.

2. After pullets are in laying houses, avoid changes of any kind, especially in feeding.

3. Start to give the old hens artificial illumination. This will keep them laying during the early fall months. They can be given a rest later.

October

1. Where lights are used be sure to feed heavily. Lights increase production because they allow the hens to consume more feed.

2. Give old hens from 12 to 14 hours of light. Use lights regularly as a change in hours may start a molt.

November

1. This is a good time to take an inventory and start a record of receipts and expenses.

December

1. Watch the body weight of your hens. A slump in production is usually preceded by a slump in body weight. Use lights on early hatched pullets to prevent a molt.

2. Where lights are used and production declines feed them moist mash. Once this is started it will be necessary to continue it until spring.

January

1. Make plans for hatching or buying baby chicks.
2. Start lights on breeding stock.
3. Feed breeders milk, cod liver oil

brooder one should make certain that the metal canopy is lined on the inside with something to keep the heat under the hover. It may be felt, asbestos, boards, celotex, or any number of different kinds of material.

2. Heating Elements:

Heating elements should be made of coil wire or a heating ring preferably operating at black heat.

Some old-fashioned brooders used lamp bulbs. They are not recommended, for they do not give sufficient heat for cold-room brooding.

3. Ventilation:

Ventilation is very important. It is needed to supply fresh air so that the chicks will be healthy and grow quickly. It is also needed to carry away the moisture given out by the chicks, thus keeping the brooder dry.

4. Construction:

The electric brooder should be of sturdy construction. The thermostatic heat adjustment, thermometer, and attraction light switch should be conveniently located for ease in operation.

5. Capacity:

Most brooders are rated on a day-old chick basis. This is about 3 square inches per chick and is not enough to carry them through the brooding period. At least 7 square inches of floor space per chick must be provided which means that a brooder 42" in diameter will care for not over 200 chicks, a brooder 56" in diameter 350 chicks, and a brooder 67" in diameter not over 500 chicks.

Crowding of chicks under the brooder hover will cause no end of trouble. If space is limited it is better to get fewer chicks and raise all of them. If you choose a good electric brooder you will find that it saves labor, raises stronger chicks with fewer losses, eliminates fire hazards, and operates economically—about 3 cents per chick per season.

How to Catch Hens for Culling

A catching hook saves leg muscles. It is better to use a hook than to let the dog run down the chicken you want for dinner. Fear and excitement do not promote egg production.

A fish landing net is also useful in landing a chicken. Gather the chickens about you with a little feed and drop the net over the one you want, then turn her quickly upside down. By the time she gets righted about, disentangled and ready to squawk, you have her safely in your hands.

raise about the usual number of chicks. The ones who are cutting down are the men who barely made expenses when conditions were favorable. These men are cutting down the number of chicks bought, or, in some cases, going out of the business entirely.

Right now egg prices are low. Some authorities maintain that they have already hit the bottom. They are low because more chicks than usual were hatched last spring, storage holdings during the winter consistently ran higher than they did a year ago, dealers who stored eggs last spring took a "trimming" and will not be in the market this spring, and consumptive demand is off due to hard times in cities.

Let's look ahead for six months and see what the situation will be then. Undoubtedly, fewer chicks will be raised and therefore there will be fewer pullets next fall, storage holdings next year should be light because dealers have had their fingers burned this winter, some poultrymen who are losing money are going out of the business entirely, and any improvement in the industrial situation will result in increased demand.

With these facts in mind, it would seem that the poultryman who is conducting his business on a firm basis should think twice before deciding to raise less than the usual number of chicks this spring. Perhaps it is no time to expand, but as one man put it, "If anyone intended to get out of the

and encourage them to roost while they are young.

5. Sell all cockerels except those saved for breeding as soon as they reach broiler size. You will receive better prices and it will leave more room for the pullets.

June

1. Do not omit mash entirely if pullets seem to mature too rapidly. You may reduce slightly the amount of protein or limit the amount of mash fed.

July

1. Begin to feed wet mash to the

How to Cull Hens

Culling for Present Production

Character Laying Hen

Vent	Large, dilated, oblong, moist.	Small, contracted, round, dry.
Pelvic Bones	Flexible and wide apart,	Rigid, close together.
Comb	Large, red, full, glossy.	Small, pale, scaly.
Wattles and Ear Lobes	Prominent, soft, smooth.	Inconspicuous, rough and dry

Judging Past Production

	Long Laying Period	Short Laying Period
Vent	Bluish white.	Flesh colored.
Eyelids	Thin and edges white.	Thick, yellow tinted.
Eye	Prominent, keen, sparkling.	Listless, sunken.
Ear Lobes	Enamel white.	Yellow tinted.
Beak	Pearly white.	Yellow tinted.
Face	Clean cut, sunken.	Full, well-fleshed, yellowish.
Shanks	White, flat, thin, creased.	Yellow, round, smooth.
Plumage	Worn, soiled, lifeless, close-feathered.	Signs of molting, loose feathered.

A good layer is active, intelligent, friendly, and more easily handled than a poor layer. A low producer is shy and flighty, and is inclined to stay on the edge of the flock.

How to Grow Paying Pullets

First, hatch or buy chicks early. Heavy breeds should be hatched by March 31 and Leghorns by April 30 in order to have pullets that will lay before October 1st.

Second, start with well-bred disease (Continued on Page 20)

Grow,

You Babies — Eat and Grow!

GROW fast. Grow strong and big. Stand wing to wing at the feed trough and eat the body-building materials that your tiny systems need.

There is a special feed to supply those materials for you. Beacon Complete Starting Ration contains each of the nutrients that your little bodies need, in the form you can eat and digest most easily. Best of all, it assures every one of you of the same chance to live and grow.

No chance for some of you to gobble up more than your share of grain—and upset the balance for all the rest, as usually happens under the old mash and scratch method of feeding.

With Beacon Complete Starting Ration in the feed trough you eat and grow uniformly. You develop rugged frames. You flesh up, and feather up in a way that delights the man who owns you. You make a high rate of gain per pound of feed that puts money in his pocket.

Eight weeks on Beacon Complete Starting Ration, and you'll be lively, up-and-coming youngsters that your owner will be proud of. "The most all around satisfactory ration I have ever used." That is typical of what thousands of Eastern flock owners say.

BEACON

that you want to turn into quick cash, order Beacon Broiler Feed to take the place of starter after the first six weeks. Specially developed for quick fleshing. As easy to feed as Beacon Complete Starting Ration.

With the A. A. POULTRY FARMER

(Continued from Page 19)

free chicks. The chicks should come from high producing breeding flocks free from pullorum disease (white diarrhea).

Third, clean brooding. Start with a clean brooding house. Keep it so by thoroughly cleaning it regularly every ten days.

Fourth, clean ground. Chicks should be raised on clean ground or wire covered yards each year.

Fifth, follow approved feeding practices. Supply all feed in troughs or hoppers. Cod liver oil should be fed in the mash.

Sixth, keep the pullets growing thriftily. This will include providing grain and mash constantly before the birds all summer and keeping the houses clean and ventilated.

Use of Lights on Poultry

The main reason for the use of lights on our poultry flocks is to increase food consumption. Where nights are long, hens will not eat enough to last until morning with a consequent cut in egg production. The best results are secured by using lights

An Easily Made Addition to Your Feeding Hoppers

enough to give the hens a 12 to 14 hour working day. This can be done by giving lights in the morning, at night or both. A third system is to turn on the lights for about an hour late in the evening for the purpose of feeding.

Little difference is observed in results from the time of day the lights are given. Lights should not be put on suddenly, neither should they be discontinued abruptly. Sudden changes are likely to throw the hens out of production and into a molt. During cold weather, in order to keep the birds active, give a very small feed of grain at noon. If birds begin to lose flesh, increase the amount of grain feed. Night feed of scratch grain should be given about one hour before the lights are turned off. Be sure that the mash and water are available to the birds at all times. When lights are properly managed, they are an important method of helping production.

Poultry House Hints

Moisture and lack of fresh air, due to improper ventilation, makes the hens lose vigor and become susceptible to colds and other troubles.

An open space near the center of the front of each pen or house at the rate of one square foot of opening to twelve to fifteen feet of floor space is recommended. These openings should be between two or three feet above the floor and longer than they are wide.

(Continued on Page 22)

The question of SPRING CLOTHES

No doubt you could use extra money for spring clothes—or other things. But where's this money coming from? Simply give your poultry Pearl Grit.

Why does this mean extra profits? 1st. Because fowls need less Pearl Grit than other forms of lime material. Thus cost is reduced. 2nd. Because Pearl Grit makes young birds grow into money faster. 3rd. Because it makes hens and pullets lay more.

You can buy Pearl Grit from your hatcheryman or feed dealer. It comes in 10-lb. boxes and 100-lb. bags. Get enough to make a real test. Pearl Grit No. 1 is for chicks up to 5 or 6 weeks old. Pearl Grit No. 2 is for all half-grown and mature poultry. Place the right size in boxes or hoppers where the birds can get at it freely.

There's no odor or flavor in Pearl Grit to cause excessive eating and waste. And there's no chance of it being infected with disease germs. It's made from clean, pure, white limestone.

Be sure to Read this Book

Drop us a letter or postal for free copy of our book on Poultry Profits. It contains much helpful information. In reading it, you'll understand exactly why Pearl Grit makes poultry pay so much more profit. This book can easily be worth hundreds of dollars to you. Write for it.

TICK-TOCK-TICK

What is YOUR watch saying to YOU? . . .

IT'S telling the story of precision—how every one of its parts are working smoothly—each part minding its own business, yet all working as one.

Precision—accuracy—perfect balance of all parts are just as important in poultry feeds . . . A chick is a delicate thing—its daily ration must be complete in every nutritive requirement. But simply adding some protein, carbohydrate, mineral or vitamin factor does not make a ration a perfect feed any more than adding a fine jewel to a cheap watch makes it an accurate timepiece.

That's why we worked five years at Larro Research Farm adjusting and re-adjusting our formulas time and time again perfecting them so that for the first time all known nutritive requirements (and that means proteins, carbohydrates, fats, minerals, vitamins, etc.) have been so fitted or dove-tailed together that they function as one harmonious whole.

Regardless of seasonal or weather conditions, whether the sun shines or whether it doesn't, Larro Feeds are complete—they require no supplements at any time.

See your Larro Dealer or write for full information on the complete line of New Larro Poultry Feeds.

With the A. A.
POULTRY FARMER

(Continued from Page 20)

Windows may be placed at the end of the open space and should be kept closed all winter. If the temperature is below fifteen or twenty degrees above zero, or if there are storms or high winds, the front will need to be covered by the curtains.

Concrete foundations, if properly constructed, are ratproof.

Extra long houses without partitions are drafty.

Alleyways are expensive, unnecessary, and undesirable commercially. They increase the cost and lower egg production.

Darken the nests, it keeps them clean and helps prevent egg eating and cannibalism.

It does not pay to crowd your flock. The lighter breeds require from three to three and one-half square feet per bird, and from three and one-half to four square feet per bird is required for the heavier breeds.

Protect your birds from the prevail-

Use for that Old License Plate

—Handy Cleaner for Dropping Boards—

ing winds. A southern exposure is usually the best.

Use plenty of clean, fresh litter. Heavy mortality may be caused by moldy litter.

Keep dropping boards clean. Superphosphate at the rate of forty or fifty pounds per hundred birds a week, keeps the house sweet and doubles the value of the manure.

Poultry Disease

All kinds of poultry are susceptible to diseases and parasites. Precautionary measures are the immediate separation of sick birds from healthy flocks, frequent removal of droppings, sanitation of feed and water utensils, and the use of clean soil in runways for both young and old birds. Good disinfectants destroy the germs of contagious diseases, parasites such as mites, and in some cases the eggs of parasitic worms. Take special care to protect young birds from infection.

Among the more serious poultry diseases are bacillary white diarrhea of young chicks and avian tuberculosis which affects principally old birds. Coccidiosis among young chicks and blackhead among turkeys are important parasitic diseases. Lice, mites, and worms take a heavy toll in many flocks. Ailments such as roup, colds, bronchitis, result from exposure.

Farmers' Bulletin 1652-F entitled Diseases of Poultry may be obtained on application to the Office of Information, U. S. Department of Agriculture, Washington, D. C.

How to Control Coccidiosis

Coccidiosis is one of the most destructive diseases of young growing chicks, usually appearing after they are allowed on the ground. There is no relation between this disease and bacillary white diarrhea. The disease is caused by a microscopic protozoan parasite which attacks the walls of the intestines and ceca, resulting in an inflammation of these organs, causing a thickening of the walls with digest-

(Continued from Opposite Page)

ive disturbances and body droopings. Land upon which chickens have ranged in the past year is dangerous. The spores of this protozoan parasite may remain in the soil in a dormant state for a year or more. When picked up with the food of the bird they pass into the intestines where they undergo a series of changes, then they are released as oocysts (corresponding to seed of plants), through the droppings.

Symptoms

A general unthriftiness of appearance is the first symptom noticed. Later a droopy appearance, sagging of wings, tendency to isolate themselves and stand under the hover or in the brooder house, heads and legs pale, loss of appetite and a sleepy attitude. The droppings may or may not be bloody. In older birds the symptoms may be complicated with leg and wing paralysis.

Treatment and Prevention

Sanitation, no doubt, is most important in the control and prevention of outbreaks. Keep the chicks in as small units as available brooders will allow. Remove the sick birds, badly affected ones should be destroyed by burning. Brooder house floors should be cleaned daily and droppings should be removed and not allowed to accumulate around where chicks can get in contact with same. Disinfect the

brooder house and runs with a lye solution (one pound of lye in forty gallons of water) or with a 3 per cent solution of cresol. Keep houses warm and dry and plenty of litter on the floors. Plenty of fresh sweet or sour milk may be kept before the chicks in crocks at all times. In bad outbreaks it may be found well to withhold the supply of scratch grain for a few days and force the chicks to drink more milk. However, after the outbreak has been controlled the change back to normal rations should be gradual. Chickens should not be allowed to drink out of pools and puddles but be made to drink only the water supplied to them by the poultryman.

In every case where it is possible the chicks should be reared on new ground. The following year it will be well to plant this range into some kind of crop. By frequent change of ranges and sanitation, considerable of the danger of coccidiosis may be overcome.—N. Y. S. College of Agriculture.

How to Run the Brooder

The brooder should be run a day or two before the chicks are placed beneath it. The correct temperature for the first week, is about 100 F. By the second week the temperature can be reduced to 90° F., and from the third to the sixth week the brooder temperature can be reduced to about 85° F. The action of the chicks rather than the reading of a thermometer is the best indication of the correct temperature. If chicks are cold they will crowd close to the stove, while if they are too warm they will begin to peep.

A couple of strands of barbed wire around the woodlot—you need no posts—is a good start to reforestation.

Sieb's OVERSIZE Chicks

BIG DISCOUNT

We want to do our share in helping the farmer and poultry raiser by giving them the greatest bargain we have ever offered. These chicks are all Sieb's very finest pure-bred OVERSIZE chicks. No second or third grade, but the kind we have bred and cultured for many years to grow larger, mature quicker and produce 200 eggs or more per hen. If there ever was a time when the poultry raiser needs more eggs and more pounds of meat per bird, it's now, and Sieb's OVERSIZE chicks should meet this emergency. Make every dollar count by raising Sieb's OVERSIZE chicks. They pay. We can ship you 100 or 10,000 of these fine chicks the day you want them. Send for catalog or order from this ad. 100% live prepaid delivery guar. **LOWEST PRICES WE EVER MADE.**

Keeping the Family Clothed

How to Test Fabrics For Fastness of Colors

A PRACTICAL home laundering test to determine the color fastness of materials has been devised as the result of scientific investigations made by Jessie V. Coles and Margaret Kirkpatrick of the University of Missouri. Many types of fabrics were tested by washing fifty times in neutral soap solutions and lukewarm water, using home laundering methods. The result was the "Washable A Test," which may be easily used by the housekeeper.

To make this test, attach a sample of colored material to a piece of white material, boil fifteen minutes in a solution of one and one-half teaspoons of neutral soap flakes or their equivalent, one-third of a teaspoon of washing soda, and one cup of water; rinse well, dry, and press with a warm iron. If the color does not run, the material may be considered color fast. The value of this simple test is obvious to the housewife who buys materials in small or large quantities.

Miss Coles and Miss Kirkpatrick also observed the effects of light on colored fabrics by exposing 103 varied types of fabrics to the rays of a quartz mercury lamp. They could devise no such simple test from this experiment as the "Washable A Test," but they drew the helpful conclusions that guaranteed fabrics are decidedly more reliable than non-guaranteed, and that fabrics which bear brand names are slightly more reliable than unmarked brands.

They learned too, that there is close correlation between the fastness of a fabric color to laundering and its fastness to light. The laundering test, they pointed out, is very much safer than a guarantee, because there is still great variability among guaranteed goods.

Do not use Black over Dark Brown, Dark Green or Dark Red

Do not use Purple over Brown, Green, Yellow, or Orange

To Freshen Old Hats

Frequent brushing adds to the appearance and life of a hat. If a black straw becomes dusty and gray, brush it thoroughly, then rub with a piece of flannel which has been slightly oiled with vaseline. After it has been cleaned in this way, give it a coat of white shellac and the straw will look like new. If the hat is out of shape it can be dampened and pressed with a warm iron before the shellac is applied.

Colored straws or white ones which have become dark may be made like

new by coloring with an oil paint thinned to the right shade and consistency with gasoline. This must be applied as quickly as possible after mixing, since the gasoline evaporates so quickly.

A velour hat which has become spotted with rain and dust, can be renovated by holding over steam and brushing with a good bristle hat brush.

Velvet can be renovated in the same way as the velour. The best way to steam velvet in the piece is to put a wet cloth over a hot iron and draw the back of the velvet across the steaming cloth until well steamed, then remove the cloth and dry the velvet by drawing the back over the hot iron.

Flowers can be steamed and straightened, then touched up with water color paint or oil paint and gasoline and made to do service for hat trimming a second season. Ribbon is sometimes worth using a second time but sponging and pressing are likely to take the stiffness out and leave it soft so that it is can be used only for draping or making soft rosettes.

—Pennsylvania Bulletin.

Clothing for College Girls

There is practically no limit to the amount and variety of garments which the college girl can use, but the New York State College of Home Economics has recommended the following as a minimum requirement:

Shoes—1 pair low-heeled school shoes such as oxfords, 1 pair dress shoes, 1 pair evening slippers.

Silk stockings—4 pair for school, 2 pair for best.

Dresses—1 wool and 2 silk for general wear, 2 for afternoon, 2 for evening.

Coats—1 slicker, 1 spring coat, 1

heavy winter coat, 1 sweater or short coat for sports.

Hats, 2

Gloves, 2 pairs

Pajamas or gowns, 3

Underclothing, 8 sets

Purse, 1

To Clean Sewing Machines

1. Remove slides, covers, thread, needle, bobbin and shuttle.
2. Remove with small instrument all lint and dust.
3. With oil can squirt gasoline or kerosene into bearings and oiling places.
4. Run machine a few seconds to work in gasoline.
5. Squirt more gasoline into each bearing.
6. Use shallow pan and small paint brush wet with gasoline or kerosene and brush out all feed works. Turn head of machine back and brush under parts thoroughly with the gasoline.
7. Be sure shuttle race is clean on long bobbin machine and open small oiling hole with a pin if stopped.
8. Follow cleaning by thorough oiling; run the machine to work oil into all moving parts.

To Clean Lace

Sometimes lace may be cleaned by covering it with warm French chalk, allowing it to stand over night and then shaking thoroughly. When washed, lukewarm water and soap solution should be used, the dirt being squeezed out rather than rubbed out. Very delicate lace should be basted on a piece of cotton cloth and washed on that to

prevent straining the lace. To bleach, put it in direct sunshine and keep moist with soap or borax solution. Then rinse thoroughly. In drying, stretch on a padded board and pin into its original shape and size (measurements having been taken before washing). Lace curtains can be placed on a curtain stretcher or pinned to a sheet on the floor. If one desires to restore a cream or ecru color, the lace should be first thoroughly rinsed in water, then rinsed in clear coffee or tea and immediately stretched.

Home Sewing Equipment

7 inch shears

A thimble that fits the finger (not brass)

60 inch tape measure with numbers starting at each end on the opposite sides.

Plenty of good pins

Needles, assorted between sizes 5 and 10

Tailor's chalk

A large tracing wheel

A lapboard or table of soft wood for tracing

A rule or a yard stick and a square

A lightweight, smooth iron

A well-padded ironing board and small pads for pressing seams

Pressing cloths of thick and thin materials

Sewing machine well oiled and in good condition placed in the best possible light

Sewing machine attachments

Dress form

Hair or wool-filled pin cushion with a thimble case attached

Bags or basket for thread and other small articles

Carbon paper for marking

Skirt hanger on a standard

Fashion magazines

A good mirror—full length, if possible

Clothing for the Baby

It is best to wash the clothing as soon as it is soiled. This will be necessary if layette consists of the minimum.

2 years	4—5½	5½
3 to 4 years	6—7½	6
5 to 6 years	8—9½	6½

To Fit Baby's Shoes

1. Length: The shoe should extend at least half an inch beyond the toes.
2. Width of toe: Permitting ample room for freedom of movement.
3. Height of toe: To avoid pinching on the top.
4. Height of instep: Many shoes are too tight across the instep which prevents proper development of the arch of the foot and results in flat-foot and fallen arches.

A hall closet, equipped for the child's outdoor clothing, which he can reach without going through any room saves wear and tear on both the parents and child.

* * *

After washing gloves, blow into them instead of squeezing them and they will dry without wrinkles.

Frock Trims From Two to Teens

Sister always needs a new dress or two, and while this pattern does not give cutting instructions for the dress itself, it does suggest half a dozen clever trims with wax transfer stamping patterns for all.

There is a pair of clown head pockets to be ruffled around and used on a wash smock, perhaps a red and white polka dot one: a Humpty Dumpty pocket which could perch on a wide second color facing, and a little Chinese girl who is mostly hidden behind her parasol which really is the pocket. However, her chow dog is in plain view.

The other three designs being conventional might be used on older girls' clothes, embroidered in soft wools, rope

silk, or six strand. Each assures a smart touch of distinction.

The school day handkerchief corners are also included in pattern No. M306, or the five handkerchiefs, each stamped on a 9" square of fine white muslin may be ordered separately as No. M307. There's one for each school day depicting washing, ironing, mending, baking and cleaning.

M306—Wax pattern group of designs for children's clothes and handkerchief corners20

M307—Five handkerchiefs, stamped, 9" square material. Per group .20

Order from Embroidery Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, New York.

To Stock the Food Shelf

Smoking Meats

All surface moisture should be dried off the cured meat before the fire is started. Do not allow the temperature of the room to run above 120 deg. F. Keep ventilators open enough to provide free circulation of smoke around and past the meat. Hams and shoulders require from 30 hours to several days for proper smoking, and bacon about 30 hours.

Sugar Cures—(1) Dry Methods—(a) For hams and shoulders; ingredients for 100 pounds trimmed meat:

Saltlbs.....8
Sugarlbs.....2
Saltpeterounces.....2

Time necessary for cure, 2 days per pound of meat. (b) For bacon; ingredients for 100 pounds trimmed meat:

Saltlbs.....4
Sugarlbs.....1½
Saltpeterounces.....2

Time necessary for cure, 1½ days per pound of meat.

Application: Mix the ingredients thoroughly. Use one-half the mixture when the meat is first packed, one-quarter three days later, and the balance on the fifteenth day. Rub it on

together without being jammed. Overhaul on the fifth, fifteenth, and thirtieth days after putting down, using the same pickle. The brine method will give bacon a milder cure than the dry method.

(c) For beef: use the brine method given for hams and shoulders. Corned plates are palatable after 10 days' cure and should be well cured in 30 days.

Pork-Sausage Recipe. Ingredients for 100 pounds pork trimming, approximately one-third fat and two-thirds lean:

Saltlbs.....1¼
Sageounces.....3
Black pepperounces.....3

If desired, the following may be added:

Red pepperozs.....½
Nutmegozs.....1
Clovesozs.....1
Sugarozs.....12

Mix the seasoning and trimmings together, and grind twice to insure proper mixing and fineness. Many prefer a 3/16 inch or ¼ inch plate. Chill as soon as possible after grinding as the process heats the meat.

For the Home Flower Garden

MISS Lua Minns of Cornell University advises us to look at the calendar rather than at the weather to tell when to sow flower seed.

She says that some flowers should have a very early start, the sweet pea for instance. In this latitude sweet pea seed should be put in the ground as early as the soil can be fitted. This means that the soil should not be wet. Sweet peas need to get a good root system while the weather is cool.

Other annuals which are vigorous and hardy and therefore can be started early are poppies, candytuft, sweet alyssum, larkspur, calendula, coreopsis, and bachelor's-button. In fact, the last three sometimes seed themselves, and the young plants live through the winter, getting an early start the next season so as to bloom in June.

Beautifying the Garden Path

The walk leading up to the steps into a house may be a stern unbending affair, or it may be winding and inviting. If the walk is already there and consists of a straight line of cement with sharply defined outlines, flowers which bend over it and soften the outlines are a wonderful help.

Those most charming walk is made of stones set in rather irregularly with grass peeping up between, and perhaps some of the more hardy flowers. Flowers which adapt themselves to the cracks between the rocks are Dianthus, Tunica saxifrage and occasionally Iceland poppies. In shady corners Nemo-phila will do well.

To soften the borders of a straight type cement walk California poppies in their bright orange color will be welcome, if freshly seeded. Other plants which are graceful to use for the advantage of being put in when in white and lilac, Carpathian bellflower, annual Chinese and Japanese pinks and Dianthus.

Of course pot plants can be used for this same purpose, and have the advantage of being put in when in flower and being removable when they are no longer attractive.

Household Measures and Weights

2 cups butter (packed solidly) 1 pound
4 cups flour (pastry).....1 pound
2 cups granulated sugar.....1 pound
2 2-3 cups powdered sugar...1 pound
3½ cups confectioners' sugar...1 pound
2 2-3 cups brown sugar.....1 pound
2 2-3 cups oatmeal.....1 pound
4¾ cups rolled oats.....1 pound
2 2-3 cups gran. corn meal...1 pound
4 1-3 cups rye meal.....1 pound
1½ cups rice.....1 pound
4½ cups Graham flour.....1 pound
3½ cups entire wheat flour...1 pound
4 1-3 cups coffee.....1 pound
2 cups finely chopped meat...1 pound
9 large eggs.....1 pound
1 square Baker's chocolate...1 ounce
1-3 cup almonds blanched, and
chopped1 ounce

A few grains is less than one eighth teaspoon.

3 teaspoons.....1 tablespoon
16 tablespoons1 cup.
2 tablespoons butter.....1 ounce
4 tablespoons flour.....1 ounce

and into the meat thoroughly, pack the cure into crevices, especially shanks and butts, and pat or pack it on the faces.

Let Calumet's Double-Action show you what fun baking can be!

If you want to know the greatest joy of baking—the thrill of turning out one glorious triumph after another—try Calumet Baking Powder. Calumet's wonderful Double-Action makes baking success so easy that it is to-day the largest-selling baking powder in the world!

Calumet's first action begins in the mixing bowl. It starts the leavening properly. Then, in the oven, the second action begins. It continues the leavening. Up!... up!... it keeps raising the batter and holds it high and light. Cakes, muffins, quick breads turn out so fine and delicate, beautifully baked—even though you may not be able to regulate your oven temperature accurately.

All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action

nor in the amount that should be used. And not all will give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action!

Whether you're new at this baking game—or whether you've lots of experience—you'll be "luckier" with Calumet. Get some to-day. Remember to use only one level teaspoon of Calumet to each cup of sifted flour. This is the usual Calumet proportion and should be followed for best results—a splendid economy which the perfect efficiency of Calumet's leavening action makes possible... Mail coupon for the wonderful new Calumet Baking Book. Calumet is a product of General Foods Corporation.

SEE CALUMET'S DOUBLE-ACTION—MAKE THIS TEST

See for yourself how Calumet Baking Powder acts twice to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that Calumet specially provides to take place in the mixing bowl.

After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment, a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's second action—the action that Calumet holds in reserve to take place in the heat of your oven. Make this test to-day. See Calumet's Double-Action which protects your baking from failure.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

Mr. and Mrs. Holly seem to be in serious trouble. As near as David can guess, it concerns money. Having no use for the gold pieces his father left him and wishing to help, he astonishes the Hollys by bringing his cap full of gold pieces.

David cannot understand why his Lady of the Roses and Jack are not on good terms. His Lady tells him that none of her hours are happy ones, and when David tells this to Mr. Jack it seems to start him thinking.

David is apparently going to make the situation either worse or better by repeating to his Lady of the Roses the story about the Princess and the Pauper which Jack told him.

The white face went suddenly pink again.

"Then, why didn't he go to her and—and—tell her?"

David lifted his chin. With all his dignity he answered, and his words and accent were Mr. Jack's.

"Paupers don't go to Princesses, and say, 'I love you.'"

"But perhaps if they did—that is—if—" Miss Holbrook bit her lips and did not finish her sentence. She did not, indeed, say anything more for a long time. But she had not forgotten the story. David knew that, because later she began to question him carefully about many little points—points that he was very sure he had already made quite plain. She talked about it, indeed, until he wondered if perhaps she were going to tell it to some one else sometime. He asked her if she were; but she only shook her head. And after that she did not question him any more. And a little later David went home.

* * *

CHAPTER XXI

HEAVY HEARTS

FOR a week David had not been near the House that Jack Built, and that, too, when Jill had been confined within doors for several days with a cold. Jill, indeed, was inclined to be grieved at this apparent lack of interest on the part of her favorite playfellow; but upon her return from her first day of school, after her recovery, she met her brother with startled eyes.

"Jack, it hasn't been David's fault at all," she cried remorsefully. "He's sick."

"Sick!"

"Yes; awfully sick. They've had to send away for doctors and everything."

"Why, Jill, are you sure? Where did you hear this?"

"At school to-day. Every one was talking about it."

"But what is the matter?"

"Fever—some sort. Some say it's typhoid, and some scarlet, and some say another kind that I can't remember; but everybody says he's awfully sick. He got it down to Glaspell's, some say,—and some say he didn't. But, anyhow, Betty Glaspell has been sick with something and they haven't let folks in there this week," finished Jill, her eyes big with terror.

"The Glaspells? But what was David doing down there?"

"Why, you know,—he told us once,—teaching Joe to play. He's been there lots. Joe is blind, you know, and can't see, but he just loves music, and was

crazy over David's violin; so David took down his other one—the one that was his father's, you know—and showed him how to pick out little tunes, just to take up his time so he wouldn't mind so much that he couldn't see. Now, Jack, wasn't that just like David? Jack, I can't have anything happen to David!"

"No, dear, no; of course not! I'm afraid we can't any of us, for that matter," sighed Jack, his forehead drawn into anxious lines. "I'll go down to the Hollys, Jill, the first thing tomorrow morning, and see how he is and if there's anything we can do. Meanwhile, don't take it too much to heart, dear. It may not be half so bad as you think. School-children always get things like that exaggerated, you must remember," he finished, speaking with a lightness that he did not feel.

To himself the man owned that he was troubled, seriously troubled. He had to admit that Jill's story bore the earmarks of truth; and overwhelmingly he realized now just how big a place this somewhat puzzling small boy had come to fill in his own heart. He did not need Jill's anxious "Now, hurry, Jack," the next morning to start him off in all haste for the Holly farmhouse. A dozen rods from the driveway he met Perry Larson and stopped him abruptly.

"Good morning, Larson; I hope this isn't true—what I hear—that David is very ill."

Larson pulled off his hat and with his free hand sought the one particular spot on his head to which he always appealed when he was very much troubled.

"Well, yes, sir, I'm afraid 'tis, Mr. Jack—er—Mr. Gurnsey, I mean. He is turrible sick, poor little chap, an' it's too bad—that's what it is—too bad!"

"Oh, I'm sorry! I hoped the report was exaggerated. I came down to see if—if there wasn't something I could do."

"Well, 'course you can ask—there ain't no law ag'in that; an' ye needn't be afraid, neither. The report has got 'round that it's ketchin'—what he's got, and that he got it down to the Glaspells'; but 't ain't so. The doctor says he didn't ketch nothin', an' he can't give nothin'. It's his head an' brain that ain't right, an' he's got a mighty bad fever. He's been kind of flighty an' nervous, anyhow, lately."

"As I was sayin', 'course you can ask, but I'm thinkin' there won't be nothin' you can do ter help. Ev'rythin' that can be done is bein' done. In fact, there ain't much of anythin' else that is bein' done down there jest now but 'tendin' ter him. They've got one o' them 'ere edycated nurses from the Junction—what wears caps, ye know, an' makes yer feel as if they knew it all, an' you didn't know nothin'. An' then there's Mr. an' Mis' Holly besides. If they had *their* way, there wouldn't neither of 'em let him out o' their sight fur a minute, they're that cut up about it."

"I fancy they think a good deal of the boy—as we all do," murmured the younger man, a little unsteadily.

Larson wrinkled his forehead in deep thought.

"Yes; an' that's what beats me," he answered slowly; "'bout *him*,—Mr. Holly, I mean. 'Course we'd 'a' expected it of *her*—losin' her own boy as she did, an' bein' jest naturally so sweet an' lovin'-hearted. But *him*—that's diff'rent. Now, you know jest as well as I do what Mr. Holly is—every one does, so I ain't sayin' nothin' sland'rous. He's a good man—a powerful good man; an' there ain't a squarer man goin' ter work fur. But the fact is, he was made up wrong side out, an' the seams has always showed bad—turrible bad, with ravelin's all stickin' out every which way ter ketch an' pull. But, gosh! I'm blamed if that 'ere boy ain't got him so smoothed down, you wouldn't

know, scursely, that he had a seam on him, sometimes; though how he's done it beats me. Now, there's Mis' Holly—she's tried ter smooth 'em, I'll warrant, lots of times. But I'm free ter say she hain't never so much as clipped a ravelin' in all them forty years they've lived together. Fact is, it's worked the other way with her. All that *her* rubbin' up ag'in' them seams has amounted to is ter git herself so smoothed down that she don't never dare ter say her soul's her own, most generally,—anyhow, not if he happens ter intermate it belongs ter anybody else!"

Jack Gurnsey suddenly choked over a cough.

"I wish I could—do something," he murmured uncertainly.

"'Tain't likely ye can—not so long as Mr. an' Mis' Holly is on their two feet. Why, there ain't nothin' they won't do, an' you'll believe it, maybe, when I tell you that yesterday Mr. Holly, he tramped all through Sawyer's woods in the rain, jest ter find a little bit of moss that the boy was callin' for. Think o' that, will ye? Simeon Holly huntin' moss! An' he got it, too, an' brung it home, an' they say it cut him up somethin' turrible when the boy jest turned away, and didn't take no notice. You understand, 'course, sir, the little chap ain't right in his head, an' so half the time he don't know what he says."

"Oh, I'm sorry, sorry!" exclaimed Gurnsey, as he turned away, and hurried toward the farmhouse.

Mrs. Holly herself answered his low knock. She looked worn and pale.

"Thank you, sir," she said gratefully, in reply to his offer of assistance, "but there isn't anything you can do, Mr. Gurnsey. We're having everything done that can be, and every one is very kind. We have a very good nurse, and Dr. Kennedy has had consultation with Dr. Benson from the Junction. They are doing all in their power, of course, but they say that—that it's going to be the nursing that will count now."

"Then I don't fear for him, surely," declared the man, with fervor.

"I know, but—well, he shall have the very best possible—of that."

"I know he will; but isn't there anything—anything that I can do?"

She shook her head.

"No. Of course, if he gets better—" She hesitated; then lifted her chin a little higher; "When he gets better," she corrected with courageous emphasis, "he will want to see you."

"And he shall see me," asserted Gurnsey. "And he will be better, Mrs. Holly,—I'm sure he will."

"Yes, yes, of course, only—oh, Mr. Jack, he's so sick—so very sick! The doctor says he's a peculiarly sensitive nature, and that he thinks something's been troubling him lately." Her voice broke.

"Poor little chap!" Mr. Jack's voice, too, was husky.

She looked up with swift gratefulness for his sympathy.

"And you loved him, too, I know," she choked. "He talks of you often—very often."

"Indeed I love him! Who could help it?"

"There couldn't anybody, Mr. Jack,—and that's just it. Now, since he's been sick, we've wondered more than ever who he is. You see, I can't help thinking that somewhere he's got friends who ought to know about him—now."

"Yes, I see," nodded the man.

"He isn't an ordinary boy, Mr. Jack. He's been trained in lots of ways—about his manners, and at the table, and all that. And lots of things his father has told him are beautiful, just beautiful! He isn't a tramp. He never was one. And there's his playing. You know how he can play."

"Indeed I do! You must miss his playing, too."

"I do; he talks of that, also," she hurried on, working her fingers nervously together; "but oftenest he—he speaks of singing, and I can't quite understand that, for he didn't ever sing, you know."

"Singing? What does he say?" The man asked the question because he saw that it was affording the overwrought little woman real relief to free her mind; but at the first words of her reply he became suddenly alert.

"It's 'his song,' as he calls it, that he talks about, always. It isn't much—what he says—but I noticed it because he always says the same thing, like this: 'I'll just hold up my chin and march straight on and on, and I'll sing it with all my might and main.' And when I ask him what he's going to sing, he always says, 'My song—my song,' just like that. Do you think, Mr. Jack, he did have—a song?"

For a moment the man did not answer. Something in his throat tightened and held the words. Then, in a low voice he managed to stammer:—

"I think he did, Mrs. Holly, and—I think he sang it, too." The next moment, with a quick lifting of his hat and a murmured "I'll call again soon," he turned and walked swiftly down the driveway.

So very swiftly, indeed, was Mr. Jack walking, and so self-absorbed was he, that he did not see the carriage until it was almost upon him; then he stepped aside to let it pass. What he saw as he gravely raised his hat was a handsome span of black horses, a liveried coachman, and a pair of startled eyes looking straight into his. What he did not see was the quick gesture with which Miss Holbrook almost ordered her carriage stopped the minute it had passed him by.

* * *

CHAPTER XXII

AS PERRY SAW IT

ONE by one the days passed, and there came from the anxious watchers at David's bedside only the words, "There's very little change." Often Jack Gurnsey went to the farmhouse to inquire for the boy. Often, too, he saw Perry Larson; and Perry was never loath to talk of David. It was from Perry, indeed, that Gurnsey began to learn some things of David that he had never known before.

"It does beat all," Perry Larson said to him one day, "how many folks asks me how that boy is—folks that you'd never think knew him, anyhow, ter say nothin' of carin' whether he lived or died. Now, there's old Mis' Somers, fur instance. You know what she is—sour as a lemon an' puckery as a choke-cherry. Well, if she didn't give me yesterday a great bo-kay o' posies she'd growed herself, an' said they was fur him—that they belonged ter him, anyhow."

"'Course, I didn't exactly sense what she meant by that, so I asked her straight out; an' it seems that somehow, when the boy first come, he struck her place one day an' spied a great big red rose on one of her bushes. It seems he had his fiddle, an' he 'played it'—that rose a-growin' (you know his way!), an' she heard an' spoke up pretty sharp an' asked him what in time he was doin'. Well, most kids would 'a' run,—knowin' her temper as they does,—but not much David. He stands up as pert as ye please, an' tells her how happy that red rose must be ter make all that dreary garden look so pretty; an' then he goes on, merry as a lark, a-playin' down the hill."

"Well, Mis' Somers owned up ter me that she was pretty mad at the time, 'cause her garden did look like tunket, an' she knew it. She said she hadn't cared ter do a thing with it since her Bessie died that thought so much of it."

How to Care for Floors

The use given the floor will decide the amount and kind of daily and weekly cleaning it will need.

Varnished Floors

Daily. Go over the floor with a clean, dry mop. This mop should be washed just as often as the dust cloth for furniture.

Weekly. Where the floor receives hard usage, go over it with a damp cloth, then rub it dry by using a clean mop.

Monthly. Wipe the floor with a cloth wrung out of a solution made by stirring 1 tablespoonful of turpentine and 3 tablespoonfuls of linseed oil into 1 quart of very hot water. About ten minutes later, go over the floor, using a clean, dry mop in order to remove all excess oil.

Waxed Floors

Daily. Brush with a clean, soft bristled brush. Follow this with a clean, dry mop.

Weekly. If the floor becomes dingy, it usually means that the surface wax has had dust ground into it. Go over the floor with a cloth or clean mop moistened with turpentine or kerosene. When the floor has dried, a little wax should be rubbed on with a weighted polisher. Avoid the use of an oiled mop or cloth on a waxed floor.

Oiled Floors

Daily. Use a soft bristled brush, a broom or a clean, dry mop.

Weekly. Wipe by using a cloth or mop wrung out of clean, warm water. No soap is needed. Avoid the use of the ordinary oil mop.

Monthly. Apply a little hot oil to the spots where the oiled floor receives the hardest wear. The oiled floor will acquire a beautiful polished appearance if a clean, dry mop is used daily.

Painted Floors

Daily. Use a clean, dry mop or a soft bristled brush.

Weekly. Wipe clean with a damp mop.

Linoleum

Inlaid—Treat as waxed floor.

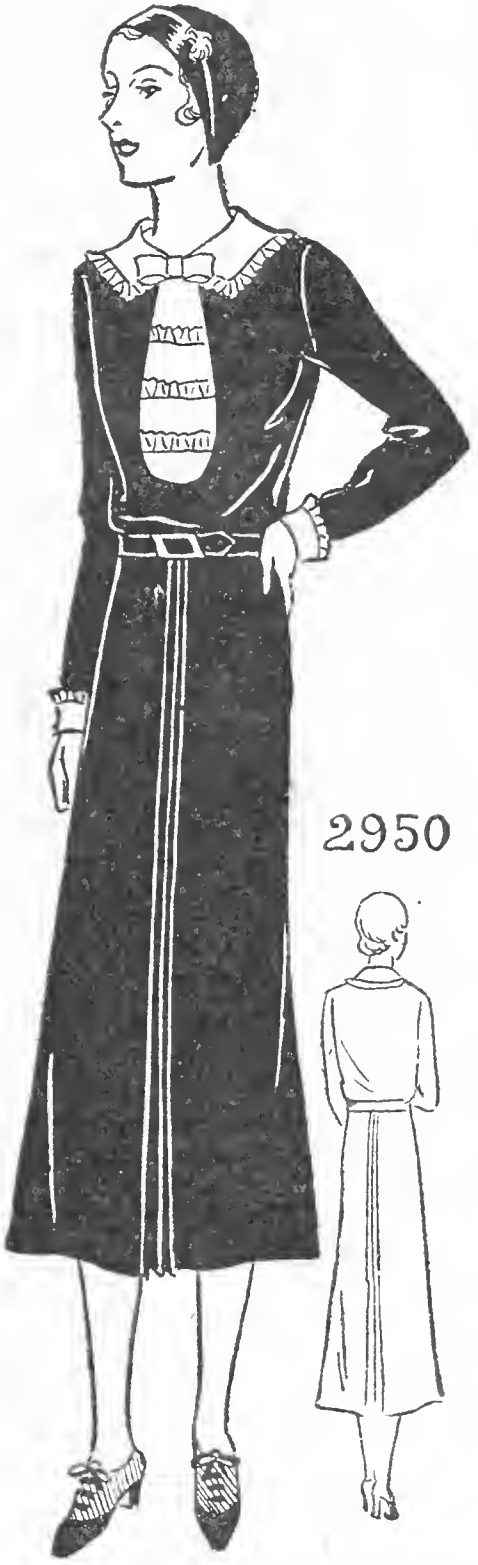

Printed—Varnish, then wax. If only varnish is used, treat as varnished floor. If wax is added, treat as waxed floor.—N. J. Bulletin.

To keep the refrigerator in good order wash it occasionally with warm water and borax, rinse with clear warm water and dry thoroughly before closing the door.

Wash the electric light bulbs frequently, and they will light the house much more effectively than dusty ones.

Clean woven rubber fabrics by washing with lukewarm suds and a brush.

Youthful Frock

2950

Tailored Model

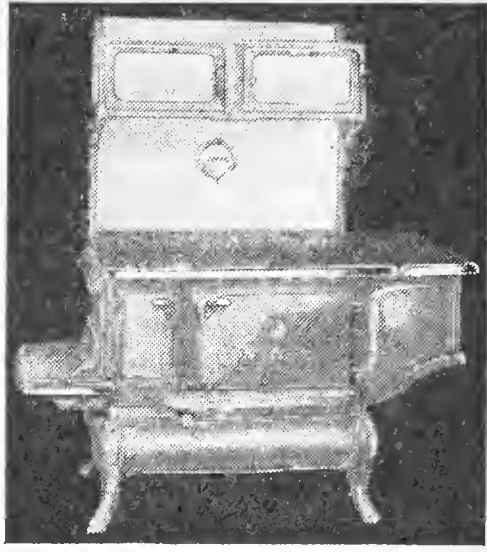

2964

DRESS PATTERN NO. 2950 is very youthful with its jumper effect bodice. High school or college misses and the youthful woman would like this dress in plain colored flat crepe silk with collar and cuffs and vestee of batiste, trimmed with lace. Wool jersey or light weight tweed would be just as acceptable for this pattern which comes in sizes 14, 16, 18, 20 years, 36 and 38 inches bust measure. Size 16 requires 3 1/4 yards of 39-inch material with 5/8 yard of 39-inch contrasting. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. (Don't send coin). Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

TAILORED DRESS PATTERN NO. 2964 is a chic little affair with a French guimpe effect which youth adores. Pilot blue crepe woolen with a lighter blue guimpe and a darker blue suede belt would be charming in this design. The circular skirt cut with gores gives the snug flat line over the hips which is so desirable. The pattern provides also for long sleeves, if wanted. The pattern cuts in sizes 12, 14, 16, 18, 20 years, 36 and 38 inches bust measure. Size 16 requires 2 7/8 yards of 39-inch material for dress with 1 1/2 yards of 35-inch contrasting for blouse. PRICE 15c.

When Writing Advertisers, Be Sure to Mention American Agriculturist

A NEW OPPORTUNITY

for
LOCAL ADVERTISERS!

AMERICAN AGRICULTURIST

Zone Plan

Offers

local advertising coverage thru 12 separate
zone editions

American Agriculturist is now publishing editions for twelve separate zones as designated by the map above. Advertising space may be purchased at an attractive rate for one or more of these zones. This plan offers a new opportunity to merchants, manufacturers, and others whose trading area is confined to one or more zones and who could not use the entire circulation of American Agriculturist. American Agriculturist circulation reaches farm homes in the territory as designated once each week throughout the year, and because of its prestige as a farm magazine over a long period of years, is sure to gain for an advertiser an excellent acceptance for his goods or services.

What Will 1930 Do To Us?

(Continued from Page 3)

machinery should be used. A man who keeps an extra hand to help milk when a milking machine would do the job, may find himself out of luck when he balances his books.

10. All movements to get nearer the consumer should be encouraged in order to cut down distributing charges. This means good, efficiently-run roadside stands, trucking products to the city wholesale markets, selling to truckers who come to the farm, and good cooperative selling associations.

11. Buy in quantity at wholesale rates and pay cash. Get your credit at the bank and not at the store.

Keep to the Middle of the Road

When all is done and said, success, whether in farming or in any other occupation, is largely dependent upon the psychology of the man at the head of the business, upon his mental attitude, in other words. The fellow who is licked to start with cannot hope for much even in good times and certainly will be down and out in meeting the situation which lies ahead this year. Again quoting Dr. Warren, "The greatest cure for business depressions is to keep mentally in the middle of the road—not to be too optimistic when times are good nor too pessimistic when times are bad, but to keep pegging along with sound business management, without too many big changes from year to year."

How foolish it is, for example, for a man with a splendid herd of cows to sell them all off now only to find that if he had hung on to his good ones dairy prices would have been fair again long before he would have had time to raise another herd.

One answer to success on the farm is not to follow blindly, like sheep, but rather to do what the other fellow does not. When the majority begins to sell, then, perhaps, is the time to think of buying, and vice versa. So, in conclusion, possibly it may be said that 1931, like all the other years, will be, to some extent at least, what you make it.

New Tools to Till Potatoes

IMPROVED designs in tractor drawn potato cultivators will be welcomed by growers. On the regular general-purpose tractor cultivator frames, spring teeth may be substituted for ordinary stiff shanks. This type of cultivator has been used for several seasons and found well suited.

Another type of cultivator or weeder consists of a number of flexible teeth, attached to a horizontal frame which fastens to the tractor drawbar. This type of weeder has been tested and used by state experiment stations and has proved a useful tool for weeding out small grass and weeds which are starting in the rows, and would otherwise compete with the potato vines. A combination use of these two styles of tillage tools should prove an effective pair for weeding potatoes.—R. A. J.

"Ditching with Dynamite," a new booklet which has just been issued by E. I. du Pont de Nemours & Company, is devoted largely to the methods developed by A. J. McAdams in collaboration with other explosives experts. Mr. McAdams was formerly of the faculty of the College of Agriculture, University of Missouri, but is now a member of the field staff of the du Pont Agricultural Extension Section. Numerous illustrations from actual photographs, and a series of diagrams supplement the carefully prepared text. There is also included a table of "suggested loads, spacings and depths for ditches of various sizes and under various conditions." A feature of this instructive booklet is a description, with diagram, of "relief" ditch blasting, whereby air spaces in the holes add to the effectiveness of the charges of explosive. The publication is being distributed by the du Pont Company.

Many perennials will bloom the second time if the blooms are cut back after the first blooming. Pyrethrum or Persian Daisy is one of these.

(Continued from Page 18)

zinc sulphate as a preservative. Molasses renders the lime more soluble and causes it to penetrate the wood or plaster surface; a pint of molasses to five gallons of whitewash is sufficient.

Silicate of soda solution (about 35 degrees Baume) in the proportion of 1 to 10 of whitewash produces a fire-proof cement.

A pound of cheap bar soap dissolved in a gallon of boiling water and added to about 5 gallons of thick whitewash will give it a gloss like oil paint.

To Make Varnish Remover

Mix four parts benzol, three parts anyl acetate or fusel oil, and one part carbon tetrachloride or chloroform.

After this mixture has been applied to the wood and allowed to stand for a few minutes, the old varnish may be scraped or rubbed off with a dull knife, steel wool or excelsior. This varnish remover and others of this type should be used only where there is good ventilation and no open flame of any kind, for it is inflammable.

Measurements and Dimensions of Many Kinds

4 inches	a hand
9 inches	a span
18 inches	a cubit
3 feet	a pace
6 feet	a fathom
12 dozen	1 gross
20 of any article	1 score
a wine gal. (U. S. standard)	231 cu. in.
U. S. bushel	2150.42 cu. inches
U. S. bushel heaped	
(heaped to a cone 6 inches high)	2747.7 cubic inches
1 gal. of water	weighs 8.3448 lbs.
1 cubic foot of water	weighs 62.425 pounds at 39.2° F.

English (statute) mile	1760 yards
Scotch mile	1984 yards
Irish mile	2249 yards
Dutch mile	8101 yards
Roman mile	1628 yards
German mile	6859 yards
Russian mile	1100 yards
Arabian mile	2148 yards
A sea (nautical) mile	2026 yards
(1-1/6 mi)	

A knot is the traveling speed of a ship, reckoned by making 1 sea-mile in 1 hour

1 Danish pound	1.102 lb. avoird.
1 Russian pound	.9 lb. avoird.
1 libra (Spanish)	1.014 lb. avoird.
100 pounds nails	1 keg
196 pounds flour	1 barrel
150 lbs. pot's.	1 bbl. of freight

An ell	usually 45 inches
A point (in type)	1/72 inch
A circle is 3.1416 times the length of its diameter (the ratio being known as pi)	

Sewage Disposal in Farm Homes

Cesspools—Where soil is sandy or gravelly a cesspool will work satisfactorily for several years, but even under these conditions we believe that a septic tank offers many advantages. There is always danger of contamination of the water supply with a cesspool which can be avoided by use of a septic tank.

Septic Tanks—A septic tank usually consists of a specially constructed concrete underground tank to which the sewage is carried. Here bacterial gasses reduce the sewage to liquid condition where it is carried through a system of drainage tile and allowed to seep away into the soil. Cornell bulletin number E48 on sewage disposal for farm homes gives complete directions for building a concrete septic tank.

New York State Egg Grading Law

Eggs offered for sale by retailers in New York State must be labeled with a grade as explained in the New

More Helps for the Farm Mechanic, Poultryman and Crop Grower

York State Retail Egg Grading Law. Grades are: nearby fancy, grade A, grade B, and grade C.

Poultrymen are not required to grade their eggs. They can sell their eggs to wholesalers, retailers or consumers without marking them by grades. However, if producers buy eggs from other sources and sell to consumers they are required to grade and mark them. The New York State retail egg grades became effective September 12, 1927, and following a hearing in Albany some changes were made in the spring of 1929.

A copy of the law may be secured from State Department of Agriculture and Markets at Albany, N. Y.

How to Crate Live Poultry for Shipping

Do not overcrowd the birds. The crate should be strong, handy, roomy, well ventilated, light, and reasonable in price. A crate four feet by two and one-half feet and twelve to fifteen inches high will hold twenty to twenty five birds, depending on their size.

Birds should be well fed before shipment, but no food need be placed in crates if the birds will reach the market the same day.

The feeding of soaked corn for the last meal is a very desirable practice.

Animal Feeds

Animal protein feeds, such as meat scrap, fish meal, tankage, and dried milk products, that should make up from eight to ten per cent of the poultry ration, are exceedingly variable in feeding value. Insist upon securing a guaranteed analysis.

Meat scrap usually carries from 45

to 60 per cent protein and is one of the most desirable animal feeds. It is the most convenient and usually the cheapest form. Be sure that the meat scrap is wholesome and fresh.

Fish products are not so palatable as meat scrap. They are lower in protein and are usually not so efficient. White fish meal is a very satisfactory source.

Tankage is less uniform in quality and does not produce as good results as meat scrap. It is not very suitable for the poultry ration.

Green cut bone is exceedingly palatable and is very desirable if fed fresh. It is not usually available in quantities but if fed at the rate of one-half ounce a day to each hen, it can replace one half of the meat scrap.

Dried and semi-dried milk products are desirable feeds and may be used with entire satisfaction where they can be obtained at a reasonable price.

Skimmilk and buttermilk are used to a large extent as a source of animal protein. A sufficient quantity, and a steady supply should always be on hand. Skim milk will almost entirely replace meat scrap if hens are given all they will drink. Twelve or fourteen quarts per hundred birds a day is necessary to do this.

Selecting Poultry Breeders

In selecting stock for breeding we must look further than the record of the number of eggs produced. Authorities have proven that individual layers have a tendency to produce certain types of eggs. Therefore a hen that produces many small or irregular eggs should not be used for breeding even though she has laid a large number of eggs.

Select for breeders, hens with a high record and also a low percentage of cull eggs due to irregular shapes and small size.

Raising Ducks

The following suggestions for feeding ducks is copied from a circular from the New Jersey Experiment Station:

"Do not feed the ducklings until they are at least thirty-six hours old.

For the first two days, feed five times daily, with a mixture, of equal parts of rolled oats and bread crumbs, and enough sand for grit, moistened with water.

After the third day add equal parts of wheat bran and corn meal to the first mixture.

After the first week, use two to three parts of wheat bran, one part each of corn meal and wheat middlings, 5 per cent (by weight) of high grade meat scrap, 10 per cent chopped green food, and about 3 per cent of sand. The ration recommended by the U. S. Department of Agriculture is essentially the same. Feed only four times daily, and three times daily after the first month."

How to Have a Better Lawn

Have soil drained properly.

A good garden loam is the best lawn soil.

In grading, disturb the relation between subsoil and topsoil as little as possible.

Prepare your lawn in the spring for early fall seeding. The last of August or first of September is usually the best. Cultivate to kill all weeds before seeding.

Seed with a mixture of four parts Kentucky blue-grass and one part redtop. White clover may be substituted for the redtop, if desired.

If lawn is shady use a mixture of three parts of Kentucky blue-grass, three parts rough-stalked meadow grass, two parts re-cleaned redtop and two parts red fescue.

To renew old lawns, rake and stir the ground thoroughly. Remove all moss and weeds as far as possible.

Approximately one-half as much seed as recommended for new lawn should be sown. Be sure to roll carefully.

Topdress new seeding with compost or well rotted manure in the fall.

Do not water unless the soil is very dry.

Leave grass cuttings on the lawn.

Topdress in the spring with a good commercial fertilizer.

Keep weeding.

Suggestions for Gardeners

1. Have the soil adapted to the crops to be grown. Be sure that the organic materials and lime content of the soil, as well as drainage conditions, are suitable for all crops in the rotation.

2. Supply sufficient fertilizer to grow a maximum crop under average weather conditions. Study the soil and crop needs, and apply fertilizer where the plant may obtain it easily.

3. Grow the varieties of vegetables which your market demands.

4. Grow three to six crops well and in large enough plantings to produce a desirable volume, instead of making numerous smaller plantings of many crops.

5. Plant only the best seed from a reliable source. Save your own seed if possible.

6. If such plants as tomatoes, eggplants, and peppers are to be grown, provide modern and reliable plant-growing equipment.

7. Plan to control insects both in the plantbed and in the field.

8. Plan to control plant diseases.

9. If quantities of water are available, make plans to irrigate the crop if dry weather is experienced.

10. Grade and pack the finished product neatly and honestly.

This is the centennial of the invention of the reaper. The illustration is a reproduction of a painting by a famous painter, N. C. Wyeth, and represents Cyrus Hall McCormick striding behind his masterpiece, the world's first reaper, at its initial public test. As is frequently the case with new inventions, the public was inclined to deride McCormick's efforts, but although the machine was crude the public test was successful.

In the distance are the Blue Ridge Mountains while the building on the left was known as Steele's Tavern. Passing along the road back of the field is a covered wagon headed for the great West.

Just David

(Continued from Page 26)

But after what David had said, even mad as she was, the thing kind o' got on her nerves, an' she couldn't see a

thing, day or night, but that red rose a-growin' there so pert an' courageous-like, until at last, jest ter quiet herself, she fairly had ter set to an' slick that garden up! She said she raked an' weeded, an' fixed up all the plants there was, in good shape, an' then she sent down to the Junction fur some all growed in pots, 'cause 't was too late ter plant seeds. An, now it's doin' beautiful, so she jest couldn't help sendin' them posies ter David. When I told Mis' Holly, she said she was glad it happened, 'cause what Mis' Somers needed was somethin' ter git her out of herself—an' I'm free ter say she did look better-natured, an' no mistake,—kind o' like a chokecherry in blossom, ye might say."

"An' then there's the Widder Glaspell," continued Perry, after a pause. "'Course, any one would expect she'd feel bad, seein' as how good David was ter her boy—teachin' him ter play, ye know. But Mis' Glaspell says Joe jest does take on somethin' turrible, an' he won't tech the fiddle, though he was plum carried away with it when David was well an' teachin' of him. An' there's the Clark kid. He's lame, ye know, an' he thought the world an' all of David's playin'."

HANDY ANDY Says "Here's How"

To Mend Rubber Boots

By Ray Inman

TO MEND A CUT OR TEAR IN RUBBER FOOTWEAR:

Sandpaper the hole and patch it as you would an inner tube, using same materials

For smoother, more permanent repair, make the following two solutions:

A. Dissolve 10 parts CAOUTCHOUC (pure rubber) in 280 parts chloroform.

B. Melt 10 parts CAOUTCHOUC, cut fine, with 4 parts rosin; add 2 parts gum turpentine. Dissolve the mass in 40 parts oil of turpentine.

Mix solutions A and B and apply to cut or tear in rubber.

(Old rubber is hardly worth repairing. dont waste time on it).

GET A HORSE, MR. WATER-THIN, A MOTOR'S NO PLACE FOR YOU!

Who is this Mr. Water-thin? He's the quart or more of thin, waste oil ordinary refining leaves in every gallon of motor oil.

It's a quart so light-bodied, so quick to vaporize under heat, that it is utterly useless in a truck, passenger car or tractor motor. It's a quart so thin and valueless that Quaker State engineers have dubbed it "water-thin"—and they throw it out!

Ordinary refining can't remove "water-thin." But in every one of

tor and passenger car. And that's why Quaker State is the world's largest selling Pennsylvania Oil!

Quaker State is made entirely from 100% pure Pennsylvania

Grade Crude Oil. Quaker State is so free from impurities that it doesn't require acid treatment in refining. That's important! For acids tend to destroy some of an oil's oiliness.

Quaker State makes a specialized oil for every passenger car, truck and tractor need. Standardize on Quaker State. It will do every farm

the Quaker State refineries—the most modern refineries in the industry—there are special, costly processes that get it out. Quaker State replaces this waste with rich, full-bodied lubricant—gives you four full quarts of lubricant to the gallon, instead of three quarts and a quart of waste. So you really get an *extra quart* of lubricant. You get far better lubrication for truck, trac-

lubricating job better and more economically. For there's a full extra quart of heat-battling, friction-fighting lubricant to the gallon of Quaker State!

THERE'S AN EXTRA QUART OF LUBRICATION IN EVERY GALLON

QUAKER STATE MOTOR OIL

G. L. F. Service

March 7, 1931

To Farmers of the New York Milk Shed:

The G.L.F. is your organization. Thirty-five thousand farmers own all its issued stock.

The G.L.F. is as independent of government supervision or operation as is any other private individual or business corporation. Under its charter, however, it is only allowed to pay 6% on its stock and it must reflect its profits either in patronage dividends or in prices on the goods it handles to those patrons who buy through it.

It is this feature of the G.L.F., namely the reflection of its profits to its farmer patrons rather than to stockholders, which arouses the opposition to it upon the part of dealers and trade organizations.

As it stands today your G.L.F. has the capital, the equipment, the employees and the experience necessary to handle a large volume of business. Furthermore, it is a going concern actually furnishing its patrons with more supplies today than it ever has since it was established in June 1920.

As a result of being in this position it needs only MORE VOLUME to insure you the best prices on high quality goods. Competitors realize this and are fighting with every resource at their command to keep you from concentrating your purchasing through your own organization. To accomplish this prices are cut, misrepresentations made, rumors spread. It costs money for the G.L.F. to meet these attacks and these additional costs have to be charged in to the prices you pay for goods bought through it.

There is one way to save this expense. There is one sure way to get rock bottom prices on feed, seed and fertilizer of the highest quality. That way is for you and your neighbor to buy through your own organization as a matter of the best sound long-time policy.

When before have you, as farmers, owned an institution financed, manned, equipped, experienced and ready to work for you? What have those who now seek to tear it down ever done for you? These are questions well worth pondering.

Respectfully yours,

H. E. Babcock

SHRINES OF AMERICA

Fort Ticonderoga

SHORTLY following the outbreak of the Revolution, Ethan Allen, a giant Vermonter, led a band of less than a hundred "Green Mountain Boys" against the British fort at Ticonderoga, New York. Arriving shortly before dawn, they took the lone sentry before he could give alarm and marched into the fort. Allen strode to the commander's door, beat loudly upon it with his sword and aroused the commander, who came stumbling out in his night-shirt. "I command you to surrender," cried Allen. "In whose name?" blinked the bewildered officer. "In the name of the Great Jehovah and the Continental Congress!" The fort was surrendered without a struggle and the colonists acquired a large supply of much needed artillery. The pictures show barracks and cannon as they appear at Fort Ticonderoga today.

DOUBLE GUARANTEE Every tire manufactured by Firestone bears the name "FIRESTONE" and carries Firestone's unlimited guarantee and that of our 25,000 service-giving dealers. You are doubly protected.

★ A "Special Brand" Tire is made by a manufacturer for distributors such as mail order houses, oil companies and others, under a name that does not identify the tire manufacturer to the public, usually because he builds his "first line" tires under his own name. Firestone puts his name on every tire he makes.

"How Shall I Fight Abortion?"

Farmer Appeals for Help After Ten Years' Struggle

RECENTLY we published a series of articles giving the facts about contagious abortion, that disease of dairy cattle which causes more losses than any other one thing with which dairymen have to contend. As a result of these articles, we received a letter from a dairyman which we publish below, without giving the farmer's name. We think this states the case of thousands of dairymen, and so in order to get some facts to give this man a satisfactory answer, we wrote to several men in different Eastern states who have made a long study of contagious abortion. Among these are Professor G. C. White, of the Connecticut Agricultural College, Dr. R. R. Birch, of the New York State Veterinary College, and Professor E. S. Savage of the Department of Animal Husbandry, New York State College of Agriculture whose answers we are now publishing.

We hope every dairyman will read what these men say about the control of abortion, for it seems to us that here in concise form you have just the information that you need to help fight this disease. The only addition we would make is more emphasis upon cleaning up barns and stables and keeping them clean with disinfectants.

Ready to Try Anything

We give below first, the letter from the farmer, followed by the answers.

"I have been very much interested in the two articles on contagious abortion in the *Agriculturist*. We have had trouble from it for over ten years and it has cost us a great deal of money through loss of production and sterility in our cows. At no time have we been entirely free from trouble, either actual abortions or animals suffering from the after effects—and we have had the disease raging to such an extent that we have had five and six abortions in the course of a month or six weeks.

"In the face of such conditions, it is not surprising that we are ready to try almost any measure to

relieve conditions. We are, however, prevented by physical conditions if not by financial stresses from adopting the only preventative measures advocated by the experiment stations and state colleges. Our barn and pasture are so arranged that isolation of part of the herd is impractical. In the barn the same man must care for all the stock. The cows have to use the same lane to the pasture, all drink from the same spring, and then rub noses through the fences with neighbors' cattle as badly infected as our own.

"Vaccination seems to us to present better possibilities than segregation. Several seemingly reputable veterinarians have recommended it to us and we know of some cases where it has been used successfully. I asked one man why the experiment stations did not recommend it and his reply led me to believe that it would be dangerous if not properly used. Can you give me any definite information about vaccination? Why do the colleges condemn it? What would be the result of vaccinating a healthy animal? Would it cause an abortion?

"We have been seriously considering selling off our present herd of Guernseys and starting over again with clean stock. Would Holsteins or Ayrshires be any less susceptible to abortions? How long would it take the natural elements—sunshine and rain—to disinfect the pastures? Is the blood test sufficiently reliable to be used in purchasing foundation stock? There is also the financial side to consider. Ordinary cows are very cheap just now. But are animals good enough for foundation stock proportionately cheap? We have twenty-two head of which probably half would go at beef prices. Could we get eight or ten clean cows for what we realized on the twenty-two?

"Any information which you can give us on this troublesome subject will be very gratefully received."

* * * * *

Vaccines Will Not Control Abortions

By G. C. WHITE,

Professor of Dairy Industry, Connecticut Agricultural College

THE experience of your correspondent is by no means unusual. Fortunately in some herds the trouble does not seem to reach the extreme degree of constant losses experienced in this particular case.

Probably this man does not have very good facilities for isolating calving and aborting cows because the probabilities are that the losses could have been cut down at periods when the disease was less rampant.

There seems to be no measures upon which we can rely with confidence except complete eradication. Vaccination is fine in theory and there are still many who recommend vaccination and there possibly are times when it is of material value. Yet there is very little reliable evidence to indicate that relief can be secured uniformly by this procedure. Vaccination is often applied after the herd has been badly hit so that seemingly great benefit is derived from it.

The principal reason why many do not see great hope in vaccination, even though it may be of some use at times, lies in the fact that the live organism must be used. There is scarcely anyone left who will argue for any benefit from the dead culture or bacterin. In using the live organism it is necessary to select a strain or strains of so-called attenuated merit of low virulency. The question is, who can say when a vaccine is entirely non-virulent or when in passing through an animal it may become virulent.

All Breeds Susceptible

In many years of experience with the disease in our dairy herd we could see no difference between the breeds so far as susceptibility is concerned. Of course, if one were to judge by a limited experience such as a year or two one might be misled in this respect.

So far as the pastures are concerned experience indicates that the organism does not long persist if discharged on the ground. It has very little resistance to sunshine and there seems little question but what the disease is ordinarily passed more directly between the infected and the uninfected animals through association in paddock and pasture.

Your correspondent suggests the possibility of purchasing new foundation stock. Unfortunately there are comparatively few abortion-free herds from which one can purchase at present and the purchasing of non-reacting cows in herds in which the disease is present naturally involves a considerable element of risk. It would be most unusual if animals were assembled in this manner if some of them did

Where Most of the Consumer's Dollar Goes

An Upstate Farmer's Impressions of the Metropolitan Marketing Districts

By WALTER HOOSE,

Assistant Editor, *American Agriculturist*

TO see the New York City produce markets should be every farmer's birthright, and it was with a great deal of pleasure that I welcomed the opportunity to see the place where the produce raised on our upstate farms enters the city, and to find out why potatoes that were worth sixty cents per bushel become transformed into something that sells by the pound and at a price that seems beyond all reason.

I had the good fortune to be connected with the farm bureau marketing party conducted by Mr. Flansburgh, Assistant State Farm Bureau leader and we arrived at the piers of the Pennsylvania Railroad about 4.30 A. M., just before

the jobbers were let on to the piers to buy for their day's needs. Mr. F. C. Corson, Assistant Agent of the Pennsylvania Railroad, met us and conducted us down through the lanes of produce. It was very much interested in the manner in which the produce was being unloaded from the cars that were on the barges tied up to the piers as it was entirely new to me.

"Could you tell me how the produce got over here?" I asked Mr. Corson as we walked on under the arching roof supported at intervals by steel pillars.

"Well, about four o'clock in the afternoon an unloading schedule is made out by the men here at the pier who are in constant communication with the holding yards over in New Jersey. As you notice, each pier is shaped something like a tee with the flat end, or bulkhead facing the street. Each space in the pier here and in the bulkhead is assigned to a car of produce which is as yet still in the yards. For example, space number one here is assigned to a car of cabbage consigned to our firm from Cortland, N. Y. Space number eight is allotted to a car of oranges from Florida."

A fruit auction on the Pennsylvania Pier New York City, where jobbers secure their day's supply.

"When the switching crew at the holding yards receive their instructions, they start to make up the trains which are then pulled to the piers on the New Jersey side. There the cars are placed on barges, ten cars to a barge, and a tug between two of these barges pushes and pulls them to the pier here. When the barges are tied up, the cars will be at the doors nearest their allotted space on the pier."

"Who unloads the cars?" I asked.

"This gang of men that you see with the hand trucks have been working here since 10 o'clock last night," said Mr. Corson.

"As fast as the cars are unloaded, they are pulled out and others are put in their places. A representative of the wholesale receiver is right here to see that everything is taken care of satisfactorily and in the case of oranges or apples

(Continued on Page 16)

Wallabout Market in Brooklyn, where Long Island growers bring their produce. The piles of produce in the foreground are owned by speculators who buy from the farmers.

Vol. 127 March 14, 1931 No. 11

Thought for the Week

ALL winter we have been thinking of making a little suggestion here that we list a few of your friends and acquaintances who have been shut in because of illness or disability for a long time and that as many as possible of us do our good turn by writing a cheerful letter to these "shut-ins," even though we do not know them personally. One of the names we wanted to suggest was that of Dean H. E. Cook of Denmark, but we kept putting off the writing of this editorial until Dean Cook passed on. Although one of the most active of men, he was confined to his house for the last two years before he died and you can imagine how hard this was for him and how letters would have helped to relieve the monotony.

Last week we called on a stranger to do some business and was shown upstairs to his bedroom where he had been obliged to spend the most of his time for many years because of a bad heart. He told us, with tears in his eyes, how heavily time weighed on him. To most of us, rushing around with never time enough to get through half of the things we want to do, it is hard to appreciate the viewpoint and suffering of the shut-in. The least we can do, even if we do not know him personally, is to write him a letter, with the understanding, of course, that we would not add to his burdens by expecting an answer.

Everybody knows at least someone who has been confined to the house all winter, or maybe for several winters. Send us their names and addresses and we will print them and give you the opportunity of helping them a lot by a good letter.

Treman for Alumni Trustee

IT would be difficult to assemble a gathering of more notable and brilliant leaders in American life than the trustees of Cornell University. One of the chief reasons why Cornell has achieved and maintained its leading place among American universities is the willingness of great and busy men to serve it as trustees.

To this board it has been suggested that the alumni of the University elect Robert E. Treman, of Ithaca. We heartily endorse this suggestion and bring it to the attention of the many graduates of the University who live on farms. If you want to help maintain the splendid standards of the Board of Trustees and of the University and State Colleges, vote for Mr. Treman.

Of course, he himself is a graduate, Class of 1909, with a good record both as a student and in athletics. Like hundreds of other Cornell boys,

Mr. Treman upheld the standards of the University in the World War, entering as lieutenant and emerging as a major. His record as a citizen and a leader in his community is admirable, and he comes from a family of Tremans who have made the name loved and respected throughout the State and who have contributed much to Cornell.

Go to Yellowstone With Us

PLANS for the great American Agriculturist Yellowstone Park trip are coming along in great shape, and the number of applications of those who have already made up their minds indicates that we are to have a very fine party indeed.

So many people, particularly after they get out of the first flush of youth, never go anywhere, even though they can afford it, because they dread all of the hard work, uncertainty, and responsibility of travel. That is the chief reason why we have organized this expedition. Those who go will have nothing to worry about and nothing to do except to have a good time. When one gets too tired, he can omit some of the side trips and return to the comfortable hotel or pullman and rest.

The food is the best that can be provided. Even the tips are taken care of, so that your first cost is your only cost—and, by the way, that cost is a good deal lower than it would be if you went alone. By combining our party, you will not only be able to see more, but do it for much less, and boy, oh boy, what you will see will be something to talk about for the rest of your life!

The bears and other wild life and the wonderful scenery of the great Park are alone more than worth the trip. There will be plenty of stop-offs at many of the intervening places between here and the Park, with busses waiting to take you to the most interesting sights. An Indian dance will be especially staged for the party.

Teachers and ministers, as well as farmers, in need of relaxation and a new outlook on life are especially invited.

The trip begins August 1st from any large station on the New York Central in New York State and you will be returned to New York in just eleven days. Full particulars will be furnished on application.

Making a Living in Hard Times

IT seems inconsistent and the wrong kind of reasoning to urge cutting down the surplus on one hand and better farming methods on the other. Such reasoning, however, is not wrong. It is the poor farmer, on poor land, using poor methods, who causes the surplus. His costs of production are high and not only is he a drawback to the whole cause of agriculture but he is his own worst enemy.

Take this bad year, for example. The only man who will make any money will be the man on good land who uses every possible scientific and mechanical device to grow high quality products with large production per acre, per animal, or per man. Professor Warren rightly points out that labor has not come down much and is the most costly item of production. Therefore, the successful man figures to accomplish the most with the least hours of labor.

Bringing this philosophy right down to brass tacks, it means starting with high quality seed—seed that will grow, and as Professor Russell points out in this issue, the highest priced seed is often the cheapest—that is, the best in the long run. After the seed comes the tillage and all the other operations. Never has there been a year when it will be more necessary to get the most out of good machinery than it will be in 1931.

Then the economists say that farmers must cut the costs of production. "All right," says the unthinking farmer, cut out fertilizer. A lot are planning to omit it, yet those who have studied the record of successful farmers through good years and bad for a generation say that this is the year

of all years to buy good fertilizer, buy it wisely, of course; know what you are buying and why you are using it, but buy it.

How then, say you, can we cut costs? If you follow the above directions and keep records, you will find that you *have* cut costs on each commodity produced during the season. If you want to go farther cut out all of the poor acres. Farm the poor acres less and the good acres more. Feed the good cows well, sell those that are no good. This, in a nutshell, is the fundamental secret by which Master Farmers and others keep going right along in both bad years and good.

A Bill to Exempt Farmers from Compensation Insurance

WE have had much to say in these columns in recent issues about the unjust compensation ruling in New York State which requires farmers to take out compensation insurance on their hired men if those men are engaged in wood or lumber operations where any of the product is sold off from the farm. As a result of our own and other agitation of this question, a new ruling was made reducing the premium for insuring men for these operations, but this is not enough. If a farmer has to pay \$166 to insure a man in order to sell a little wood or lumber, you can rest assured that he cannot or will not do it. The cost of the insurance is, in most cases, more than any profit he would make out of the operation.

Farm leaders in the Legislature well know this, and Assemblyman F. L. Porter, who also is President of the G. L. F., has recently introduced an act to exempt farmers from the compensation insurance for logging or woodcutting operations. This bill should pass, of course, but whether or not it does will depend, to some extent at least, upon the support it receives from the farmers themselves. The bill is Assembly Bill No. 1135. Write or wire Mr. Porter your views.

Look Out For Too Cheap Seed

AGAIN we call the attention of our readers to the need of watching out for poor farm seeds, particularly clover seed. There seem to be great quantities of this kind of seed on the market, seed which is of unknown origin and utterly unadapted to New York and other Eastern state conditions.

Insist on Northern grown clover and alfalfa seed. Southern seed, either from Europe, the South, or the Pacific Northwest, will not withstand ordinary winter temperatures in New England. Buy seed from those you can trust and make them tell you where it comes from.

Eastman's Chestnut

THERE is something about human nature that always makes the other fellow's pasture, to all of us, seem better and greener than our own. Like the cows we are always crowding our heads through the fence, even if we stand in knee-deep clover on our own side. How often we find, too, when we do get out of our own back lot that there are just as many or more stones and weeds over the fence!

Our friend, Dan Dean, well-known potato grower of Nichols, New York, told the following story at the Connecticut Vegetable Growers' Association meeting last winter:

"Over a hundred years ago, a Connecticut resident became so disgusted with his neighbors that he resolved to leave the state and emigrate 'Out West' as central New York was then called. When he had crossed the boundary line into New York State he got out of his wagon, knelt down, and thanked the Lord that he was out of Connecticut. After exactly one full year of the hardships of a frontier life, he returned, and after passing the state boundary the second time, knelt down and thanked the Lord that he was back again in Connecticut!"

Are Cheap Seeds Really Cheap?

High Producing Strains Cost More -- and Are Worth It

By F. P. BUSSELL

New York State College of Agriculture

ARE cheap seeds really cheap? This question means are seeds low in price really priced low in proportion to their value as seed. The word cheap, as commonly used, has two very different meanings and shows how tricky language may be. Cheap is an old English word that originally meant price. Then it came to have the significance of our word bargain; that is, it signified a relatively low price in proportion to value. Still later it was used to refer to something costing little in money, effort or labor and therefore of comparatively small intrinsic worth. In asking whether or not cheap seeds are really cheap, we are asking whether values are low or high in proportion to price. Are cheap seeds really a bargain?

This year farmers are under strong temptation to cut crop production costs in every possible way. The bank account is low, the pocketbook thin. Though the outgo for seed is relatively small, yet it is an item and must be considered. In the present seed market many are tempted to observe price and overlook value. This is a tragic mistake. Price and seed value may be entirely unrelated. The price differential between good and poor seed is usually not large, in fact sometimes poor seed is sold at a higher price than is good seed. The seed user's real concern is seed value. This point settled, the prospective buyer may shop about if he chooses to find where he can obtain the best value at the lowest price.

What to Look for

But suppose the seed buyer is honestly seeking value and is willing to pay the price necessary to secure it. How shall he picture for himself the thing he wants and in what attitude of mind shall he approach his task? And, finally, what must he know in order to intelligently carry through? What fundamental qualities must good seed possess? Briefly speaking, there are four: four that are fundamental and a few more that are frills.

The four basic requirements of good seed are good heredity, high purity, robust health and strong germination. Seed of a pure variety means seed of uniform heredity throughout. Barring differences due to environment, it means uniformity in plant characters and in harvest returns. The other day a peck sample of oats arrived at my laboratory. With it came a request that I examine the sample and report the name of the variety. I found the sample to consist of four distinct botanical types. This sample fairly represents many cars of oats sold cheaply on the market as seed oats. They are often given a variety name which is wholly meaningless as it actually applies to no distinct hereditary type.

Do Not Fool Yourself

The point I make is that seed of high varietal purity can't be produced and sold at a price as low as seed with no breeding back of it and with little or no care taken to preserve its varietal purity. A good illustration is the case of Grimm alfalfa. Grimm seed sells at a premium of from six to ten cents per pound over seed of common alfalfa. The latter seed may appear to be as good in all respects as Grimm, but it lacks the essential character of winter hardiness. Grimm seed can't be produced and placed on the market at as low a price as can common. The man who thinks he is getting Grimm values when he buys common or affidavit Grimm is pretty apt to be fooling himself.

In the main, seed prices are governed by supply and demand. There is no real monopoly in the seed business. In fact the market is highly competitive and it follows that seed prices generally reflect inherent seed values. If alfalfa or red clover seed is offered you this season at prices considerably below that asked by reliable dealers for high

quality seed, you should at once be suspicious. The chances are that the value you seek is lacking and that the price asked is really very high.

Study the Tag

And in this connection I want to add that there are many dealers who are earnestly seeking to provide the kind of seed that you ought to have. They must pay more for it than for mediocre seed and must ask more. In buying seed, find out all you can about its origin, breeding and purity. Examine the tag carefully and ask questions. The seed business would soon be on a high specialty plane if seed users would but know what they want and insist on having it.

As the second of the four basic requirements of good seed, I mentioned freedom from weed seeds. Year by year our fields are becoming more and more infested with persistent weeds; dock, quack, Canada thistle, plantain, pigeon grass, and others. How did we come by these pests anyway? Let us face the facts. We or our fathers sowed them along with forage and grain crop seeds. How will we get rid of them? The complete answer I do not know; but I do know that we won't get far in cutting our enormous weed costs until we stop sowing weed seeds on our farms. The statement is made that the weed bill on our farms is over a billion dollars a year. If this is true, it is high time that we do something about it. If you are using home grown seed, clean it well before sowing. If you are buying seed, find out if it is free from noxious weed seeds. Your seed laboratory can give you this information. Be sure you get it and act upon it.

Diseases Cut Profits

Freedom from seed borne diseases is a factor in seed which is often overlooked. Last summer I saw two fields of barley, both of the same variety and growing on the same farm. In one, the yield was cut 25 per cent by loose smut; in the other there was no detectable damage. The latter was sown to seed produced by a specialty seed grower. The seed was clean and so was the crop. The other field was sown to infected seed and the grower sustained a loss far greater than the cost of high quality seed last spring.

And last but not least, seed must grow. Strong vigorous germination gets the plant off to a quick and early

start. Our spring sown cereals begin growth, blossom and produce grain or forage in the few short midyear months. The initial advantage of a quick healthy start persists from planting to harvest.

I started out to talk about "cheap" seed. I have ended by discussing good seeds. The only really cheap seed from the standpoint of the buyer's interest, is the best seed. Poor seed may and often is sold on the basis of appearance. It may be bright, heavy and of good color, but these are the frills. They are good talking points for the seller, but will be given minor consideration by the intelligent buyer.

In this talk I have considered seed values only from the standpoint of financial returns. In the nature of

things this must be a matter of first consideration. But I cannot forbear to mention that the convert to the gospel of good seed finds other rewards awaiting him, less tangible perhaps, but nevertheless real. To grow a crop well, be it wheat or beans or barley, engenders in the grower a just pride and a righteous self respect. Grasping the idea that he and nature are partners in an enterprise, the harvest is to him the outcome of a joint collaboration. He has done his best: best seed, best fertilizer, best tillage. The outcome symbolizes an inner satisfaction and a spiritual enrichment known only to him who does well the undertaken task. His reward is not alone in money. It is not limited to fields rich for the harvest or bins heaped high with grain. Added to these is a pride of achievement that is just, and a contentment that is real, for it is earned.

From the A.A. Mail Bag

TWENTY years ago Lady Cornell held the world's championship as an egg producer with 257 in her pullet year. Today so many birds have passed the 300 mark that they don't even get their names in the paper. Twenty years ago 200 bushels of potatoes to the acre was a big yield. Today the man who cannot produce 400 bushels per acre is not heard of in potato circles beyond his own cross road.

All of which goes to show that we have made great strides in the production end of our business. But—Editor Eastman says he has had great difficulty in getting good butter, and that he doesn't eat his full quota of eggs because he can't get good ones regularly and with confidence that they're going to live right up to the label. He knows what good butter and eggs are because he once produced them. And Mr. Eastman represents only one of some millions of American families in the cities.

Today the price of eggs is a disaster to the producer. Many will be forced out of business. Why? Because Mr. Eastman and some millions of other families are not eating the eggs which they should eat because we have never made really high class eggs freely available to them.

We have been spending millions in public money through out colleges and Farm Bureaus and other public agencies to increase the efficiency of production. We have done it. We have ar-

rived. Now let's stop. I don't mean recede. Just stop where we are and catch up the other end, the consumer demand end. A hard job, you say. What of it? We have just done one fair sized job, increasing efficiency of production. Why not really tackle the other with the same vim and the same financial resources with which we have arrived on the production end.—F. H. Lacy.

Are Cows to Blame for Poor Butter?

AFTER reading "Personal Experience of a Consumer," Page 4, December 27th, I would like to give you my experience and conclusion as a butter maker, in a small way.

Fifty years ago poor butter was unknown with us, the cream was churned and the butter packed through the summer in firkins and in the fall in tubs, or half firkins, in the winter that butter was shipped to the New York market. The butter kept in perfect condition and always sold at full market price. In those days the cows had no grain throughout the summer and fall months, and in the winter only low protein grain, corn and oats ground together. The cows were not pushed with high protein feeds so as to produce heavily, garget and other diseases were unknown. Now according to our agriculture papers, garget is "A bane of the dairy industry."

A few years ago we sold our dairy and now only keep one cow, and, of course, make butter for home use, with various results, for instance, we had one cow from which it was absolutely impossible to make good butter, after three or four days it would go strong and have an unpleasant odor. She was a Guernsey and we considered her milk as being exceptionally good. We sold her for beef and bought another in her place, and we could not make poor butter from her milk, at least we never had any poor butter; it would keep indefinitely. Being an old cow she was sold for beef and another cow bought, and now poor butter again.

Cow No. 1.—Her milk was set in pans for the cream to rise. Cow No. 2—kept her for about a year, for the first 6 months milk set in pans then we got a small separator and thereafter separated the cream. When the separator was flushed with water the separator was clean, no milk stuck to any part of it.

Cow No. 3—present cow, when the separator is flushed there is milk left in the separator with slight indications of garget, although the milk goes through double thickness of cheese cloth, (finest weave) absolutely clean.

My conclusions are that cows No. 1 and No. 3 sometime have had garget and that there are traces yet which prevent the making of butter that will hold its quality.—E. P.

A Homemade Snow Plow That Works

This is the first year that the Newark Valley (Tioga County) Central School district has been in operation. Young people above the sixth grade are transported by three busses for several miles over drifted hilly roads, but in spite of the worst winter in this section in many years, these busses have never missed a trip and it is only once in a while that the young folks are even late to school. When a purchased snow plow failed to keep the roads clear a local mechanical genius built homemade plows on each bus which plow through the heavy drifts and bring the busses through.

Our First Spring Thaw

By M. C. BURRITT

FOR the first time since winter came upon us last December, the snow is gone and the ground is practically bare. It is the first real thaw of the winter, which though it has been mild, has been steady. With few if any real

M. C. Burritt

severe storms, we have had a light but a steady cover of snow all winter. And we are still without an abundance of rain to fill cisterns and wells and saturate the land. Just enough rain and melting snow has been available to keep us going.

The past week has been one of beautiful sunshiny weather and has been an opportunity to push the pruning. Ours is now nearly two-thirds done on the first of March. Many growers have their pruning well along but others do not seem to be concerned about it and have done practically none. To me pruning always seems a first and necessary step to growing good fruit. It thins the branches and hence the fruit and makes it easier to do a good job of spraying. It can shape and strengthen the tree and increase and maintain its capacity by stimulating new growth.

Lower Costs but Maintain Quality

I think I see a tendency on the part of many growers to let down the standard of quality and to produce at the lowest cost possible. This is, of course, due to the ability to sell poor quality with increasing ease to the trucker and to the altogether too small price mar-

gin between No. 1 quality and No. 2. When an unclassified apple pack sells within 15 or 25 cents a bushel of a U. S. No. 1, there is not much encouragement to produce better quality by better and consequently more expensive methods. But meanwhile Western carloads of fruits and vegetables of the best quality well packed and highly standardized are pouring into our Eastern markets and more and more taking them from us. Freight rates compel the distant shipper to send only his best, but we who are near can often sell by means of the truck almost any quality and sometimes, unfortunately, with as much or more profit. The truck has made our problem of standardization, which is one of our most important in the East, increasingly difficult. It is offsetting much else that we are doing to promote quality, and is a problem so serious that it calls for most comprehensive treatment.

We Must Lay Our Plans

Once again, each of us as farmers must decide how we are going to farm in the coming year. Shall we operate at the lowest possible expense regardless of good yields and quality and take what comes knowing that if it is less and poorer, that expenses too are less? Or shall we operate at the highest possible efficiency for yield and quality seeking low cost per unit and the highest return per unit? For some of us this problem will settle itself because we may have neither the money nor the credit to do what we would like to do. More and more production is being restricted by this inability and this will influence the total of production. Those of us who are free to make our own decisions, should remember that though we might win over our immediate neighbor in net return neglecting quality, that as a state we will be gradually yielding the markets at our doors to those distant others whose situation compels them to give attention to quality and to standardization. This is true of eggs, apples, potatoes, and many other products.

We are urged by the Farm Board and others—including no less than an ex-president—to reduce our production and thus remove the menace of the surplus. But few understand that this can only be wisely done by the gradual elimination of the marginal producer. A farmer on good land, well equipped with favorable producing conditions cannot as a rule wisely slow down his operations. Many of his costs and overheads such as interest, taxes, depreciation, living costs, even his own wages, go on just the same and must be met. Such men must keep their operations near the maximum or be overwhelmed by accumulating costs. They may shift their enterprises but their gross production must remain high.—Hilton, N. Y., March 1, 1931.

Peach Trees

WITHIN a half hour's ride of where I live is an old man who planted ten acres in peach trees on his farm ten years ago. He was an old man then and his neighbors made fun of him and said he would never live to pick the first crop. When those trees were four years old it was a peach year in Ohio and he had a good crop. The next year he had a good crop. The third crop was short. Within the ten years he had six good crops in all including the short one. He told me himself he cleared in the ten years \$22,000.00 and his sons went into the fruit business after him.

—R. H. GWINNER.

That rough patch of rocky ground in your flower garden can be made more attractive by using rock cress and Cerastium, or mouse-ear. The cress is showy with its white flowers, while the mouse-ear is low, creeping and hardy with attractive silver foliage.

HOW TO GET A BIGGER FARM WITHOUT BUYING more land

INCREASE your yield per acre, and it's just like adding acres to your farm — without tying up money in extra land. Instead of working more land, reduce your cost to grow by making each acre produce more. You can do this with the help of Armour Fertilizers.

No matter what crop you grow — corn, potatoes, tobacco, fruit, truck or canning crops — there is an Armour Fertilizer for each one — an Armour Fertilizer to increase the yield, improve the quality and hasten maturity.

Use Armour Fertilizers this Spring! Get more bushels or pounds from each acre. Your Armour dealer will supply the grades suited to your crops and soils. See him the next time you're in town.

When Shall I Spray for Codling Moth?

THE apple-destroying codling moth has long been considered a pest of settled habits which worked with deadly efficiency on a routine schedule that could be counted upon with as much certainty as the average railway time table. And if a season passed when serious damage was caused by the moth in spite of heavy and regular spray applications, the apple grower merely sighed and blamed his spraying method or the arsenical poisons used and hoped for the best when another season rolled around.

But finally one of two experiment stations began to get curious and asked themselves a few questions. Why does spraying prevent codling moth damage some years and not others? Is the life of the moth lived in a regular cycle? Does the trouble lie in weak and inferior arsenicals? Do we really know when the moth emerges and does its damage?

And in the last question lay the answer. After two years of heavy damage from the codling moth the Missouri experiment station set about establishing breeding cages to determine what part the irregularities in the development of the pest might play in the epidemic. Last spring most of the apple blossoms were off the trees by April 25 and the calyx spray was completed before the last of the month. Under normal conditions the grower would have expected moths on the wings by the first days of May and the cover spray for young worms would have been completed before May 10. Where a second spray was applied it would have been completed by May 20, completing the spray program for the majority of apple growers.

But what really happened, showing that the codling moth is evidently off its normal cycle, was this: The first moth at the Columbia station emerged May 21 and the peak was reached June 4, with the first entrance of worms of importance occurring on June 12. Thus growers without breeding cage records would have completed their spraying for first-brood before the moth emerged and three weeks before the worms began to enter the fruit in any number, practically nullifying the effect of the sprays which were applied at the usual specified time.

Apple growers will insure themselves against probable loss from wormy fruit during the coming season if they will keep in close touch with their state experiment stations to determine the actual date of codling moth emergence. Where it is not practical or convenient to keep in touch with the station, the grower can establish breeding cages in his own orchard and determine the proper time to spray. When the moth emergence date is actually known, the regular series of high pressure sprays applied at the customary intervals will insure a crop of worm free apples in the fall.

False Blossom

FALSE blossom is a serious cranberry disease. It has been spread long distances in shipping the plants to set out bogs. Insects such as the leaf hopper are the chief spreaders of this disease over the individual bogs.

The greatest hope is the development of a disease resistant strain. The McFarlin seems to be coming along fine in this respect. The new variety must be hardy, produce attractive fruit that stores well, and be resistant to storage rot as well as false blossom in order to be popular with the growers.

The only sure way to kill lice and ticks on sheep is to dip each animal in one of the standard dip solutions.

There are 200 practical applications of electricity and of General Electric equipment to farming. Consult your electric power company—find out which of these labor-savers will bring you the greatest immediate profit.

Dependable General Electric Motors Make Irrigation Dependable

FARM profits depend on a sufficient supply of moisture. Plenty of rain at the right time brings a bumper crop. A drought means diminished profits—often loss.

Irrigation is crop insurance! It may be profitably used not only in arid sections but on almost any farm. It pays to have an irrigation system for those periods in the growing season when nature's supply of moisture is insufficient.

Electricity and G-E motors, at small cost, will pump water automatically into reservoirs which can be emptied upon the land whenever you wish. Or, this life-sustaining water can be applied directly to the crop through overhead sprinkling or surface irrigation.

Last year, an apple-grower provided an irrigation system for his orchard. He says:—"My apple

crop was greatly improved in both quality and quantity. But the greatest benefit from irrigation will be in next year's crop because healthy fruit buds for next season were developed during this year's dry period. Irrigation alone made it possible for them to grow properly. But for irrigation, many of my trees would have died. I am sure my irrigation system will pay for itself in one year."

With electric pumping, irrigation is a matter of interest to every farmer. G-E motors and automatic control are found on leading pumping equipment. Investigate the profit possibilities of irrigation for your farm. When ordering specify G-E motors and control.

Renewing an Old Pasture

We have an old worn out pasture, hill-side, which we want to renew. I want to know the best way to seed. It is a small part of a field—about two acres. How about oats, sweet clover and timothy? When should sweet clover be sown? We'd expect to lime it.—D. I. McC., Pa.

I FEEL very certain that you are not likely to get a very good seeding if you do not fence the newly seeded area off from the rest of the pasture. This is because the young seeding coming on will be more palatable than most of the growth present on the rest of your pasture field and consequently there will be a tendency for the stock to overgraze the newly seeded area. Overgrazing is always hard on pasture lands and it is especially so when the grass has been seeded for only a short time. Therefore, I do suggest that if it is at all possible you protect the newly seeded area by a fence at least during the next two years. The fence is not for the purpose of preventing any use of the pasture area. It is rather for the purpose of keeping the stock out of the newly seeded area when it may be desirable to do so.

I assume that you are desirous of seeding this area not only so that you will get as much feed as possible during the next year of two but so that you will get a permanent pasture plot out of it. To accomplish this purpose you may sow oats this spring and along with the oats you may put out a pasture mixture. My idea would be that you would graze the oats off when they are a foot or so high or about the time they begin to head. As soon as the growth had been pretty well eaten down you would remove the stock until the new seeding was in position to give a fair bite along in August or September. At that time you would graze the area again being careful to remove the stock before they had opportunity to do real damage to it. For a pasture mixture on the acre basis, I would suggest the following:

Timothy	5 lbs.
Kentucky blue grass.....	8 lbs.
Canada blue grass.....	5 lbs.
Sweet clover.....	12 lbs.
Alsike clover.....	5 lbs.
White clover.....	2 lbs.

The mixture should be sown at the same time that the oats are put out. The main precautions to be observed in seeding the sweet clover are to use scarified seed of the biennial white blossom variety and to use inoculation on the seed. Assuming that you lime your land sufficiently to grow sweet clover well the only other special fertilizer precaution that you need to observe is to treat the land at the time of seeding with 200 lbs. or more to the acre of 16% superphosphate or with a mixed fertilizer carrying an equivalent quantity of phosphoric acid.

If you proceed in the fashion suggested it can be expected that your reseeded area will give you considerable grazing this coming summer. In 1931, provided it comes along well and it will if the conditions are favorable, the sweet clover should make a large growth and should furnish the greater proportion of the grazing afforded. At the end of that season the sweet clover will largely die out because it is only a biennial. The other pasture plants will then gradually begin to establish themselves and in a few years should have a good hold on the soil. The hold obtained by them will be greater if they are sowed with sweet clover than if they are sowed in some other manner. Thus the use of the sweet clover results in two marked benefits; first, giving a larger amount of grazing in 1931 than would otherwise be obtained and giving a better stand of the permanent pasture grasses than is likely otherwise to prevail. As a further suggestion, I believe it would be worth your while to consider beginning, about the spring of 1933, top-dressing the improved area about each alternate spring with 200 lbs. of 16% superphosphate to the acre. Such a treatment as this might also not be amiss on the unimproved part of your pasture field.—John Barron.

How to Give Alfalfa the Right Start

FAILURES to secure a good stand of alfalfa may often be due to a poor seed-bed at the start or to lack of plant food sufficient to give the new seeding a good enough start to carry it through the first winter. A soil pulverizer or corrugated roller is essential in getting a good firm seed-bed and is useful in preparing the soil for other crops where there is a tendency to form clods.

Your county agent or state college soils department can tell you whether or not, or in what quantities, lime, superphosphate or potash are needed. Lime may be applied either with a manure spreader equipped with a lime-spreading attachment; endgate spreader; or a forced feed sower. Superphosphate may be easily applied with a manure spreader; but if a mixed fertilizer is to be used the forced feed broadcaster is preferable. It may also be applied by an attachment on the grain drill putting it in at the same time as the alfalfa.—ROBERT A. JONES.

New Vegetables Listed by Professor Work

SPEAKING to a group of commercial vegetable growers at Farm and Home Week, New York State College of Agriculture, Professor Paul Work emphasizes the importance of the "Break O'Day" tomato. This variety is the result of a cross between the Marvanna and the Marglobe and will probably have a material effect on the tomato industry because of its great resistance to fusarium wilt.

Another important variety change is the development of the National Pickling cucumber. This variety is prolific, short and stubby, especially developed for commercial production of small pickles.

The Red Core Chantenay is a medium length, solid, deep orange color carrot of a new strain.

"How Shall I Fight Abortion?"

(Continued from Page 3)

not later react. It can be done, however, if one exercises proper judgment and precautions.

Another procedure that this man might follow if he has the facilities would be to purchase a group of calves not over six months of age. In this way he could buy some of the best lines and most excellent prospects and if they can be raised without association with adult stock there is little danger of their becoming infected. Such a group of animals could entirely replace the infected group in the course of two or three years, going right into the quarters vacated by the other herd providing a few hours elapsed and a reasonable amount of precaution was taken in disinfecting the mangers and stalls.

* * *

Blood Test for Abortion

By DR. R. R. BIRCH

New York State Veterinary College

THE best procedure this man can follow is to have his entire herd blood tested by some thoroughly competent graduate veterinarian. Then the individual cows should be checked over carefully by the veterinarian so as to determine just how each should be handled. Some no doubt would be sold for beef, some held pending another test, and others placed on the farm where they will be least likely to spread the infection to other cattle. If the veterinarian is in doubt the Veterinary College will gladly help out.

Vaccination is not recommended by Experiment Stations because it is not uniformly effective; because it causes cows to react to the blood test, thus reducing their sale value, and because it sometimes infects cows instead of immunizing them. One never knows just what results he will get when he vaccinates, and while it is apparently successful in a few individual herds, it is a failure as a program for the control of the disease.

All breeds of cattle are susceptible to Bang abortion disease. It is possible that Ayrshires and Holsteins are a trifle less susceptible than Guernseys but Ayrshire and Holstein herds frequently are found in a condition such as your subscriber describes.

While it is impossible to say just how long it takes nature to free cattle quarters of the Bang bacillus it usually does not prove persistent in quarters which have been well cleaned and disinfected, and vacated for two or three months.

* * *

How to Fight Abortion

By PROFESSOR E. S. SAVAGE

New York State College of Agriculture

(1)—Vaccination. It is my understanding that the veterinary profession as a profession has ruled against vaccination for abortion for the following reasons. First, vaccination of an animal with live organisms would, as I understand it, cause that animal always to be a reactor to the blood test because in a sense the animal would have a mild attack of abortion.

(2)—What is this man to do? I believe that I would advise him first to have a blood test made on his herd. The Bang abortion blood test is made, as you know, on the blood itself and not on the cow. The procedure is simply to draw a few cc. of blood from the jugular vein and have it tested by proper authorities. I believe that this testing should be done by a centrally controlled laboratory, and that means for New York State, the laboratory here at Cornell University. Doctor Birch

(Continued on Page 11)

"Making a profit at today's milk prices demands the

Most Milk from every pound of feed"

says Uncle Charlie—

DURING all my years in the feed business I never have seen a time that called for such careful selection of dairy feed as today's low milk prices make necessary. The B-B guarantee of *most milk per dollar of feed cost* never meant so much to dairymen as it does right now.

Wouldn't results like the following help you to make a profit on your herd this spring? These are not at all unusual increases after dairymen change to B-B.

Make Gains Like These

"1200 more pounds of 5% milk from 12 cows each month on B-B feed," writes D. F. Huston of West Grey, Me. "The first week I tried B-B on one cow she gave 110 pounds more milk," reports J. E. Slyder of Seven Valley, Pa. "Two full pails more a day on B-B," writes M. B. Ryan, Bomoseen, Vt. "75 lbs. more a day with B-B," reports Howard Kriebel, Landsdale, Pa. "My cows gained 10 gallons a day on Bull Brand," says Oscar Martin of Oakdale, Md. "After changing to B-B feed my herd jumped 40 qts. a day," writes Robert Bell of New Egypt, N. J.

B-B holds a ten-year-record for being the most productive feed because it is formulated with this objective constantly in mind. In the buying, cleaning and blending of the ingredients that make up B-B's choice protein content and perfected mineral balance all our long experience is utilized in producing a feed that maintains herd health and gives you most milk for your feed dollar.

DAIRY RATION

More Productive—Yet Surprisingly Low In Price!

This enables us to ask you to join the B-B family under our no-risk, money-back guarantee. Thousands of other dairymen have accepted this offer.

Test B-B At Our Risk

Just go to your dealer and order enough B-B feed to supply one or two cows for 30 days. (Write me direct if your dealer can't supply you.) Feed it according to directions and *watch the milk chart*. If B-B doesn't come through with better results than you've had from any other feed, the dealer will return every cent you paid. He won't question your judgment or figures. Just give him the empty bags and your figures and he will hand over your money.

That's certainly a square shooting offer, isn't it?

Maritime Milling Co. Inc.
Buffalo, N. Y.

B-B Guaranteed Dairy Feeds include 24%, 20%, 16%—a suitable protein content for every grade of roughage. Also a complete line of Poultry Feeds.

The American Agriculturist Advertisers Are Reliable

It's Wise

... says Dr. Vansant

Dr. J. W. Vansant

A Veterinarian with a large practice in eastern Pennsylvania and widely known as a breeder and exhibitor of pure bred, high-producing dairy cows.

to condition
cows for

Calving

Spring calving . . . following months of close stabling, limited exercise and forced feeding for high milk production . . . brings in its train a definite hazard to the health of dairy cows. The yearly bill to dairymen for serious disorders following calf-birth . . . in most cases entirely preventable . . . is a huge one.

One simple and common-sense precaution is now being widely practiced by cow owners to cut down the yearly drain on dairy profits due to preventable calving troubles. Conditioning of cows with Kow-Kare before, during and after calving to enable them to withstand the shock to their vitality at this period pays large dividends in cash as well as peace of mind.

Kow-Kare the Ideal

Calving Conditioner

The added demands on bodily vigor caused by the normal functioning of the reproductive organs call for more help than normal diet and good care can provide. Extra supplies of Iron and certain minerals, plus tonic and regulating drugs are a valuable and needed aid at this time.

Kow-Kare, the concentrated preparation of Iron, the great blood tonic, balanced with potent drugs, herbs, roots and pharmaceutical minerals, provides a genuine Con-

ditioner for cows about to freshen. Its use for a few weeks before, during and after calving costs surprisingly little . . . definite benefits are assured.

Aiding Milk Yield by Conditioning

Cows whose productive vigor falls off after a winter of barn feeding actually lose money for their owner. Expensive feed is consumed without an adequate return in the milk pail. And even when turned out to pasture it often takes weeks or months to attain a profitable productive capacity. Regular Kow-Kare conditioning pays because it costs so little, and definitely aids the cow to maintain a high yield at a minimum hazard to health. Buy Kow-Kare from feed, drug, hardware and general stores, \$1.25 and 65¢ sizes. Mailed postpaid if your dealer is not supplied.

**LIVESTOCK
BREEDER**

Stallion Has Colic

I have a valuable standard bred stallion that has sick spells every three weeks since the 20th of November. When they come on he throws himself against the wall and squeals and kicks both hind legs as hard as he can and smashes everything he strikes. His legs and ears are warm, mouth moist and natural color. Some symptoms suggest spasmodic colic, but he does not lie down and roll over. His eyes are wild and staring and he kicks and carries on almost continually and gets wringing wet.

These spells usually last about 24 hours. He also got where he sucks wind. His teeth were bad so I had a veterinarian the first sick spell he had. He said it was his teeth so he fixed them and he also advised me to feed him one quart of corn meal and three of bran steamed from one meal to another and fed twice a day, night and morning. This did not help. He does not gain in flesh as these spells take off all he gains from one spell to the other. He is a valuable horse and I hope you can give me some remedy.

YOUR stallion seems to be troubled with what would appear to be spasmodic colic due to digestive disorders though, of course, the spasms may be due to entirely different causes. Proper treatment will depend on the cause. If due to colic, the treatment during an attack would be for that disorder of which there are a number of remedies, the following being a common one:

Sulphuric ether	2 ounces
laudanum	2 ounces
Linseed oil	½ pint

If relief is not obtained in one hour, repeat the dose. Cloths wrung out of hot water to which a small content of turpentine has been added and applied to the abdomen will be of service if the horse is quiet enough to make the application. Otherwise, you may rub the abdomen with a stimulating liniment or mustard water.

If colic or digestive disorder is the cause, the feed and care needs consideration. Avoid feeding indigestible feed, large drinks of cold water, cold rain, drafts of cold air, driving through streams or any other sudden change. I note you are feeding two quarts of cornmeal and six quarts of bran. I would suggest omitting the cornmeal, possibly substituting sound oats for the meal and reducing the amount of grain. The hay should be clean, nutritious and possibly limited in amount until the trouble clears.—M. W. HARPER.

Ewes Need Extra Feed Now

BREEDING ewes in New York are under a heavy strain during the month of March. Ewes are carrying and developing one or more lambs, growing a fleece and maintaining their bodies. They have been on dry feed a long time, the weather is often inclement, exercise is often neglected, all of which tends toward the accumulation of poisons in the sheep's body.

Ewes cannot eat enough hay alone to obtain sufficient nourishment to take care of the drain on them at this time without the danger of developing an anemic condition often fatal to many of the most productive ewes. Good sheep husbandry at this time means alfalfa or clover hay, fed with barley or oats, or both, with a little wheat bran, exercise, plenty of salt and fresh water.—MARK J. SMITH.

Breeding Mares

When do mares commonly come in heat after foaling?

MARES usually come in heat the ninth day after foaling and the period commonly lasts two or three days.

Brighten up the banks of the brook with marsh marigold, or cowslips. It serves the double purpose of furnishing greens in early spring and beautiful bright flowers which may be cut for the table.

FARMEX FACTS

Charles Newbold of Burlington, New Jersey, took out the first U. S. patent on a plow made of iron in 1797. Farmers said the iron would poison the soil . . . Although he showed splendid fields of grain grown on land he had plowed, and spent \$30,000 in his efforts—he finally gave up in disgust.

FARMEX EXPLOSIVES

Often the introduction of new ideas or methods are slow and tedious. It took years to establish explosives as the cheapest, easiest, most economical way of making ditches, removing stumps, and breaking boulders on the farm . . . Today, thousands and thousands of pounds of Farmex are used each year for such work. Write for information on explosives and special booklet on ditching.

"How Shall I Fight Abortion?"

(Continued from Page 9)

has assured me that they will test blood samples that are sent in here for a small price per sample.

After a man finds the condition of his herd then he can decide what to do. If his herd is badly infected with the disease I think that he should clean up his premises by disinfecting and then isolate the cows to the best extent that he can. If he cannot put them in a separate building then he should put the reacting cows, until he is able to get rid of them, in one corner of the barn and be absolutely sure that he does make some provision for isolating these cows two weeks to a month before and after calving. A cow is not a very dangerous spreader of disease, as I understand it, except at the time of calving.

I know what it means to ask a man to sacrifice his whole herd and possibly that is not necessary in this case no matter how severe it is, because he can, I think, gradually eliminate this disease and certainly he is no worse off than he was before.

In my judgment if he sells these cows for beef or practically that he won't be able to get over \$25 a head, and that means he can only buy back three or four good cows because good cows cost money.

A man has got to take off his coat and go after this job. There is no question in my mind about this because the continual loss is too great a sacrifice to make by keeping an aborting herd. Vaccination will not cure the disease. A man has got to make up his mind to take his loss and get clean, and while it is a long drawn-out process I believe it can be done by the gradual elimination of the worst offenders, and by as much segregation as is possible. I think that very soon it will be impossible to sell to any advantage at all positive cows, so that I think the sooner a man takes hold of this thing and goes at it the better.

Training the Bull

NOT a week goes by that some dairyman does not get hurt or killed because of carelessness in handling a bull. Any bull should always be regarded as a dangerous beast. Sentiment for one of these animals is misplaced. Of course, there is a great difference in the disposition of different bulls. This difference may be due to the kind of treatment that the bull has had from calfhood. If he is firmly handled as a calf and taught to recognize man as his master, he is not likely to forget it. Some men think it is smart to tease a bull. They or some one else may reap bitter results.

The bull should be halter broken at an early age and when he is a yearling a strong ring should be inserted in his nose. Of course, the horns should be removed and the best and most humane method is to use caustic potash before the horns have started growing.

Grain Rations for Different Roughages

What amount of protein in a grain ration is usually recommended for clover hay or alfalfa hay?

ROUGHLY, a 16 per cent protein ration is recommended for feeding with clover hay and a 20 or 24 per cent ration for use with timothy hay. There seems to be a tendency, however, toward feeding a grain ration containing a slightly lower percentage of protein than was common a few years ago.

The baneberry is good for planting in the border or under trees. It has giant spikes of showy flowers in spring followed by berries in the summer.

MAKING MILK WITH LESS FEED!

PURINA COW CHOW is built for the big job of making milk. That is why it can make milk with fewer pounds of feed. Actually, 88 pounds of Purina Cow Chow will do the job of 100 pounds of ordinary feed. 9 cows fed Purina Cow Chow will produce the same milk as 10 similar cows fed the average feed. These figures come from a recent national farm-to-farm survey of 27 months...a survey of 1,104,151 cows...a survey covering 48 states.

Because Purina Cow Chow is so good you will find that it will get the most out of whatever home-grown feeds you may have. Whatever your feed...whatever your feeding problem...Purina Cow Chow is built to do that very job. The sort of feeding job that puts milk in the pail with the fewest pounds of feed...for the fewest cents per gallon. Purina Mills, 898 Checkerboard Square, Saint Louis, Missouri.

Milk Prices

March Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream	1.66	
2A Fluid Cream		
2B Cond. Milk	1.91	
Soft Cheese		
3 Evap. Cond. Milk Powder	1.50	1.30
4 Hard Cheese		
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for March 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Continues to Fluctuate

CREAMERY SALTED	Mar. 7, 1931	Feb. 28, 1931	Mar. 8, 1930
Higher than extra	29 1/4-29 3/4	29 1/4-29 1/2	36 1/2-37
Extra (92 sc.)	28 3/4	28 3/4	36
84-91 score	24 1/2-28 1/2	25	28 1/2-29 1/2-35 1/2
Lower Grades	23	24	23 1/2-24 1/2 28

The butter market has continued to operate along the same lines we reported last week. At no time was it safe for one to make any definite prediction as to the future movement of quotations. The market opened on March 2 in a very weak state. Prices slipped away to the extent of a 3/4c loss bringing creamery extras down to 28c. This brought out the buyers in full force and by Friday closing time 92 score butter was selling at 28 1/2c. From then on until Friday trading was good and a firm market prevailed with sentiment indicating greater confidence although tempered with conservatism. This developed into a stronger market on Friday when creamery extras went to 28 3/4c. On Saturday, March 7, one sale of butter was reported at 29c. However, there was no general buying at that figure and only a few purchases were made on the basis of 28 3/4c. As we have stated previously, this continual pumping the market only serves to disturb smooth working order of business.

Butter has been moving out of storage fairly well. From February 28 to March 6 holdings were reduced 1,189,761 pounds, whereas during the same period last year holdings were reduced 910,382 pounds. These figures are for the four principal cities. On March 6 the four cities reported holdings totaling 12,957,614 pounds whereas on the same day a year ago they held 17,354,667 pounds.

We do not look for any material changes in the market. Large distributors report a very good consumptive demand and buyers are taking on full supplies for their current needs, but are not showing, except in rare instances, any disposition to anticipate their wants.

Cheese a Shade Easier

STATE FLATS	Mar. 7, 1931	Feb. 28, 1931	Mar. 8, 1930
Fresh Fancy	16-17	17-18	18 1/2
Fresh Average			
Held Fancy	21-22 1/2	21-22 1/2	24
Held Average			23

The cheese market as a whole is a shade easier. Supplies of Western cheese have been full and plenty, and although a moderate amount of business has been done at the present levels there is an undertone that indicates softness. In New York State, especially in the northern part, more cheese factories are opening up and New York has experienced a slight increase in shipments during the last few days. The trade took hold rather

slowly and receivers have been forced to trim prices with the result that fancy and special stock has been getting 16c to 17c for specialties. Held New York State flats are moving in small lots but prices are firm due to the moderate supply.

Eggs Market in Better Shape

NEARBY WHITE	Mar. 7, 1931	Feb. 28, 1931	Mar. 8, 1930
Henney			
Selected Extras	25 1/2-26 1/2	24 1/2-25 1/2	32
Average Extras	24	23 1/2	29 1/2-30
Extra Firsts	23	22 1/2-23	28 1/2-29
Firsts	21 1/2-22	21 1/2-22	
Undergrades	20	21	
Pullets			
Pewees			

NEARBY BROWNS	Mar. 7, 1931	Feb. 28, 1931	Mar. 8, 1930
Henney	24	26	23
Gathered	20	23 1/2	20

The egg market is in better shape this week although prices are only a shade better than what they were a week ago. In the first place New York's supply has been running behind the same period a year ago. This has helped the market materially giving it an opportunity to work into the storage reserves. They are now down to a relatively small supply. As a matter of fact there has been some advance in values. Another helping hand in the market is the firm position existing in Chicago and a more confident outlook on the part of Western storage operators whose buying interest has been sufficient to clear offerings of fancy fresh stock. Some speculative interest is still noticeable although not general. There is still a wide divergency of views as to the security of the present values. Sales for future delivery at Chicago continue at a level that was recently generally considered above the safety mark.

The consumption of eggs has been very satisfactory. Retail prices have been held relatively close to the wholesale market although of late advances are said to have shown some reduction.

The improved state of affairs has greatly benefitted nearby eggs. Because of the improved condition on the West, Pacific Coast whites have been working higher. This has reacted to the benefit of nearbys. Receivers have shown more confidence in their buys of late and have shown less urgency to sell. They do not seem to fear slight accumulations.

A few duck eggs are beginning to come forward and are selling over a range of 40c to 48c.

Heavy Freight Receipts Hurt Live Poultry Market

	Mar. 7, 1931	Feb. 28, 1931	Mar. 8, 1930
FOWLS

DUCKS, Nearby	24-27	24-27	24-25
GESE	16-17	18-20	18-19

The live poultry market staggered under burdensome freight receipts during the first week in March. Early in the week there was some hope that prices would hold at 22c, but by Wednesday the week's listings showed a total of 231 cars and good hopes went to pot. This had a direct effect on the express and truck market, for colored fowls sold at their freight values. Leghorns on the other hand cleared readily and some stock with the exception of fancy worked out at a premium. Because of their scarcity fancy chickens sell well. Broilers opened slow but receipts have been quite limited and in view of a good demand prices have shown an upward trend. All other lines of poultry appear to be holding firm. Hen turkeys easily bring 37c to 40c but poor stock and old toms sell down to 25c.

Meats and Livestock

Cattle—Receipts 1,210 including 1,000 directs. One load Good 1305 lbs. fed Virginia Steers about steady at 9.00. Cows in moderate supply, mostly steady. Common to medium 3.50-4.75. Low Cutters and Cutters 1.50-3.00. Bulls nominal.

Vealers & Calves—Receipts 1,630 in-

cluding 1,610 directs. Light supply New York and other nearby Vealers steady. Good to Choice 8.50-10.50, latter price top for Choice New York offerings. Few Medium grades, 6.00-8.00.

Hogs—Receipts 1,600 including 1,570 directs. Hogs steady. Few medium 295 lb. averages 7.00. Good to Choice 160-200 lbs. averages 7.50-7.75.

Sheep—Receipts 4,000 including 3,960 directs. Small lot Medium 67 lbs. New York Lambs steady at 8.00.

Country Dressed Calves—Receipts liberal during the week. Demand slow all through. Market weak and irregular and not cleaning up on Friday. Fresh receipts per pound: Choice, 10-12c; fair to good 8-10c; small to medium 5-8c.

Hothouse Lambs—Receipts moderate to liberal during the week. Demand slow and for fancy only. Undergrades hard sellers some carried over daily. Market weak. Good to fancy, each 8.00-10.00; fair to good 6.00-8.00; imitations, each 2.00-5.00.

Live Rabbits—Receipts light to moderate during the week. Demand slow at lower prices. Market closed steady at 12-20c per pound.

Heavy Supplies Hit Hay Prices

Heavy supplies of hay in all of the New York markets plus a limited demand resulted in accumulations in the hay market that caused a general decline in prices. Most of the arrivals consisted of medium to poor quality hay. Strictly No. 1 timothy in large bales was extremely scarce. As the market came to a close on March 7 the situation was very undecided and the market irregular. Straight timothy has brought anywhere from \$22 to \$27, with mixtures ranging from \$20 to \$26. Clover mixtures have brought \$1 over grass mixtures. Straw has been in more limited supply and is meeting a good demand with wheat and oat at \$12 and rye at \$14.

The bean market has experienced very dull trading during the first week in March and the situation appears to be growing a little weaker. On many lines values are not clearly defined. The following represents a general range of prices: Jumbo Marrows \$5.75 to \$6.25, with Average Marrows \$1 lower; Pea beans bring from \$4.75 to \$5.25; Red Kidneys \$9 to \$9.75; White Kidneys \$6.75 to \$7.35; Round Cranberries \$5.75 to \$6.40.

Old potatoes are sustained with some difficulty. Only the fanciest receive \$3. Maines generally bring from \$2.75 to \$3.25 with Long Islands from \$3 to \$3.25 per 150 pound sack. The dull situation in the potato market is not confined to any one section, all lines having a tough time.

The cabbage market has been very dull. Bulk cabbage from New York State brings from \$16 to \$18 per ton, when shipped in bags is brings from 75c to 90c per 90 pound bag.

Farm News from New York

Commissioner Morgenthau Sends New Orders to Game Protectors

IN a general order to the Game Protection force issued by Conservation Commissioner Henry Morgenthau, Jr., a number of changes are mentioned that should make for an improved protection service. Every Inspector and Game Protector is required to familiarize himself with the Conservation Department laws pertaining to fish and game. No alcoholic drink or narcotic drug may be kept upon the person of any member of the force. No reward of any kind shall be accepted by members of the department except by written permission who may direct its acceptance for some charitable purpose.

All game protectors and inspectors shall conduct themselves in such a way as to secure the cooperation of the people in the proper enforcement of the conservation law. We believe that the farmers of the state will be more than willing to cooperate with these new rules.

Legislation Favored By A.A.

THE following legislation now before our state government is favored by the New York State Grange and by the American Agriculturist. We believe that our readers will cooperate in aiding the passage of the bills.

Empowering Conservation Commis-

The winner of the prize for the month of February in our news writing contest for students in high school vocational agriculture, is Lloyd P. Smith of Cassville High School.

sion to replace suitable trees for those destroyed by the Highway Dept.

The Héwitt reforestation bill and the continuous acres of reforestation by the State be reduced from 500 to 250 acres.

Senate bill No. 269 which proposes to consolidate regional fairs.

Assembly bill No. 272 in relation to regional markets under State control.

The strengthening of all enforcement laws, especially the 18th amendment.

A reduction on automobile registration fees taken out after March 1st.

The Marten act to be made effective against stock and securities frauds.

The State sending expert assessors to all towns requesting same.

The 1931 Legislature to work out a more equitable way of raising taxes as to relieve real estate.

An equitable tax on income.

That rights of way for improvement or reconstruction of State or County Highways be acquired by the Dept. of Public Works, at expense of the State.

For a lower tax on trucks used exclusively by farmers for personal use only.

A reduction in size and use of out door bill boards.

Amending the highway law to provide that motor vehicle operator leaving the scene of an accident without reporting shall be guilty of a felony instead of a misdemeanor.

The use of St. Lawrence River as Hydro-electric power for northern New York supply of electricity.

Ulster County Dairyman Heads List

ACCORDING to the Dairy Herd Improvement Association's report for January, there has been a marked improvement in the number of cows on the honor roll in the 66 cow-testing associations under its control. High cows for the month in order of their rank were owned by W. E. Bruyn, Wallkill Valley Association, Ulster County, whose registered Holstein cow produced 2746 lbs. of milk, containing 115.3 lbs. of fat. Robert Curren of the Chemung Association, Chemung County had a registered Holstein that produced 3209 lbs. of milk containing 105.9 lbs. of fat.

Smith and Fuller of the South On-

ondaga Association, Onondaga County, had a registered Jersey which produced 103.3 lb. of fat from 1476 lbs. of milk.

James Stark of the Dutchess Association, Dutchess County, had a registered Holstein, producing 101.1 lb. of fat from 2907 lbs. of milk.

Clarence Reed of the Eastern Wayne Association, Wayne County had a registered Holstein which produced 3224 lbs. of milk, containing 99.9 lbs. of fat.

This is certainly an enviable record in production for the men in these associations.

James A. Young of the North Allegheny Association, Allegheny County, N. Y. holds a high herd record for production for the month of January. Thirteen cows averaged 2113 lbs. of milk containing 69 lbs. of butterfat.

Congress Makes Record on Appropriations

APPROPRIATIONS were passed by the 71st Congress just ended, totaling about ten billion dollars, the highest peace-time mark of any single session of Congress. The high record up to date is held by the 65th Congress, which during war time, passed appropriations during its second session totaling 27 billion dollars. Previous to the World War, the annual expenses of the government seldom exceeded two billion dollars.

Among these appropriations were several of direct interest to farm readers. Additional funds were appropriated for the use of the Federal Farm Board; substantial appropriations were made for the relief of drought-stricken farm areas in southwestern states; and appropriations were made to provide for loans to needy war veterans.

Listen for Radio

A NEW feature of special interest to Western and Central New York farmers is the daily presentation of news and editorials written by the American Agriculturist staff, from 12.10 to 12.15 noon on Monday, Wed-

nesday, and Friday of each week from radio station WHAM, Rochester, N. Y.

Mr. E. R. Eastman, editor of American Agriculturist, will present an editorial on some subject of importance to Eastern agriculture on Tuesday, Thursday, and Saturday. It is our aim to interpret the news and to pass along a few suggestions that will enable you to make more money and cut down farm expenses.

We will be more than glad to have your comments and suggestions as to the type of information you enjoy most. This broadcast is an addition to our weekly broadcast during the noon hour over WGY on Wednesday when news of general interest will be presented.

Waterville Future Farmers Put on Program

AT a meeting of the Parent-Teachers Association the Waterville Future Farmers recently held an agricultural program in the Eastman Auditorium of the Waterville Central School.

Various articles made in shop such as milking stools, foot stools, magazine racks, smoking stands, an airplane, etc., were exhibited near the stage and before the start of the program the parents were invited to inspect some of the work being done in shop. All of the articles had the name of the boy who made it, his grade and the name of the article. The workmanship was especially good.

Glenn Bowers a member of the agriculture class gave a short talk on what had been done by the class. He also introduced his classmates and announced the demonstration.

The demonstrations that were held were as follows: "How to Test Milk," by Parker White and Orville Jones. The equipment used for this test was put on a table on the stage and the explanation was made while the process was being shown. The next demonstration was that of "Making Electrical Splices" by Roland Chamberlain of the eighth grade. One method was demonstrated. Wire, blow torch,

solder and tape were used. The final demonstration was "How to Select a Good Dairy Cow." This explanation was made by Anthony Ferucci.

At the end of the program Professor Riley, who is at the head of the Rural Engineering Department of the State College of Agriculture at Cornell University gave an illustrated address on a 7,000 mile motor tour, with which he and his 16 year old son covered practically all of the United States. The tour covered the great agricultural sections and also the scenic places of interest. The illustrations were given by pictures. They gave an excellent idea of the various parts of the United States and methods of farming in each.

About 150 persons were present at this meeting. After the program many parents and friends had a much better idea of what was being done in the Agriculture Department of the High School.—Glenn Bowers.

Oleomargarine Bill Will Become a Law

SOME time ago, the Commissioner of Internal Revenue granted the manufacturers of oleomargarine the privilege of using colored cooking fats, such as palm oil and soy bean oil in the manufacture of their product.

The latest report from Washington states that the Brigham-Townsend Oleomargarine bill, taxing all margarine yellow in color, ten cents a pound, has been signed by President Hoover. The bill was passed by the Senate late Monday evening and when returned to the house was passed by a large majority. The signing of the bill by the President means that it will become effective on June 1 1931. The farmers of our own dairy section should be commended on their splendid effort toward securing the passage of this bill.

Good breeding and management if followed consistently with the farm poultry will result, over a period of years, in increasing production and profit.

New York County Notes

been forced to haul water for their stock, since early last fall.

Potatoes are a drug on the market at 80 cents per bushel and eggs are plentiful at 22 to 25 cents per dozen; also local peddlers have reduced the retail price of milk to 10 cents per quart.

Plenty of dry hard wood is offered on the local market, at \$4 per cord so the cost of living has been reduced quite materially, the past few months.

The rights of way for the new state highway, leading from Port Leyden through Lyons Falls and on to Lowville, have been acquired and it is expected that construction work will be started as soon as weather conditions permit.

Farmers completed their annual ice harvest some time ago and though the quality was the poorest in years an ample supply was secured to insure proper cooling of milk the coming season.—C.L.S.

ONTARIO COUNTY—The weather for the past month has been quite variable, but with no exceedingly cold weather. We have had no need to go to Florida for congenial weather. We have had it right here. Wheat has had a good covering of snow all winter. The drouth that we have had since last summer has been broken, and water is more plentiful. It certainly has been a record breaker for farmers.

—E.T.B.

SARATOGA COUNTY—We have had beautiful weather for past week or two—March surely entered like a lamb.

The roads are very good—snow is deep for cutting wood.

Water is very scarce; many wells are dry.

Eggs—22c per dozen at local stores. Milk and butter prices continue low.

—Mrs. L.W.P.

ORANGE COUNTY—Word has been received here that the Supreme Court has ruled in favor of New York City allowing them to divert over seventeen miles of the best farm land, that of the Neversink Valley, in to a source of water supply for the city's use. It seems a shame that these fertile farms in Orange and Sulli-

van Counties, productive of over a million dollars' worth of produce yearly, should be put under water.

Produce prices are stable with demands mild. Slight drop in eggs to the present 27 cents a dozen.—F.R.H.

OSWEGO COUNTY—February has been quite fair.

Quite a lot of snow yet, but roads are bare. The county has kept them plowed. Oswego County is pleased at having a Master Farmer and such an estimable one. Most everything is low. Hay quoted \$17 to \$19 a ton. Many have their ice in.

—J.S.M.

CATTARAUGUS COUNTY—E. N. Williams, county deputy in the grange, is making his official visit to the 27 branches of the organization in the county. George W. Bouce, Elkdale, a former school commissioner, and a member of the first graduating class of Ten Brook Academy, Franklinville, delivered an address covering the boyhood experiences of Abraham Lincoln in the county seat grange hall in Little Valley on February 21.

Western New York Notes

Drifts have settled greatly under the bright sunshine of the last week of February and fields are two-thirds bare but the great banks that were thrown up along the roadsides by the snow plows look as though they may last for months. The country around Hamburg and Angola has had unusually heavy snow. With all the sunshine, there has been a cold wind so sugar-making has not begun.

Hatcheries are not doing as large a business as usual. Some are taking a chance on raising the usual number of chicks but many are ordering fewer, or none at all.

Egg production, which by March 1st, should begin to step up seems rather to be dropping slightly. White Henner egg prices stay at the same level—19 and 22 cents.

Fifty to sixty dollars seems to be the going price for grade cows.

Danger of Infection

Among Baby Chicks

Success in raising baby chicks is dependent upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of contaminated drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbour germs and ordinary drinking water often becomes contaminated and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Take the "stitch in time that saves nine." Remember that in every hatch there is the danger of some infected chicks—danger of diarrhea in some form and other loose bowel and intestinal troubles. Don't let a few chicks infect your entire flock. Give Walko Tablets in all drinking water for the first two weeks and you won't lose one chick where you lost dozens before. These letters prove it:

Mrs. Bradshaw's Remarkable Success in Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 420, Waterloo, Iowa, for their Walko Tablets for use in the drinking water of baby chicks. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens are larger and healthier than ever before. I have found this Company thoroughly reliable and always get the remedy by return mail." —Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko Tablets to be used in the drinking water for baby chicks. It's just the only thing to keep the chicks free from disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko Tablets entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is when used in the drinking water for baby chicks. So you can prove—as thousands have proven—that it will reduce your losses and double, treble, even quadruple your profits. Send 50c for a package of Walko Tablets (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Pioneer National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

Walko Tablets are sold by leading druggists and poultry supply dealers.

WALKER REMEDY CO., Dept. 420, Waterloo, Iowa

Experience Taught Me HOW TO RAISE CHICKS

Heart-breaking losses showed me that something was wrong with the usual methods of raising chicks. I studied out the causes of these losses and corrected them. Now, I raise 90% and better, producing plump broilers and fine pullets. You can do as well by following my methods.

The story of my early struggles and final victory is told in a booklet which I will gladly send free. Write today.

With the A. A. Poultry Farmer

Where Will We Put the Chicks?

By L. E. WEAVER,
A. A. Poultry Editor

EVERY rule has its exceptions, and this has been particularly true of that old reliable one of chick rearing—"put the chicks on new soil each year." Many times people have told us—"but why should I? I've raised them on that

L. E. Weaver

same place for 3 or 5—or perhaps it's 10-years and they have never had any diseases." And indeed I know of an orchard in which chicks have been raised successfully over the past 8 or 9 seasons. Yet those are exceptions and the failure to get the brooder houses away from the infected soil and on to clean ground has so often resulted in disaster that we must continue to advocate the old rule.

However, in talking recently with Professor J. G. Halpin of the Wisconsin Poultry Department, I got an idea that seems to be an explanation of at least part of those exceptions. I am passing it on as something for our readers to think about. Professor Halpin says that it is his observation that when chicks are successfully reared on the same area several successive years almost invariably it is on a heavy grass sod. His explanation is that the grass keeps the chicks separated from the soil and that the frequent rains wash the infection down to the soil and into it and out of the reach of the chicks. In other words, the heavy grass serves the same purpose that woven-wire floors serve in confinement rearing. And surely, free range is to be preferred to confinement if disease and parasites can be avoided. Professor Halpin's idea certainly sounds logical.

Avoid Bare Ground

There are other conclusions that would naturally and logically follow from his theory. First of all, we may conclude that bare spots are to be avoided on any brooding range. It is on such spots that the chicks can pick up the infection which has been carried over. We see these places where the brooder house stood last season. There is usually no grass over quite an area surrounding the buildings. So in any case it is going to be wise to move the house to a new and well-sodded location. The only thing I can think of to do with the bare spot is to put wire netting around to keep the chicks off. Or perhaps it can be seeded thickly with oats or other grain which will get enough of a start to serve as a carpet before the chicks are large enough to do it much damage.

Another question that this theory brings to my mind, is—"What about these shady spots under hedge rows and around clumps of bushes and shrubs where the chicks love to congregate on hot days." There is no grass there. Infection, if present, must accumulate rapidly. May they not be our worst breeding places for disease?

Perhaps in spite of the value of shade, we would do well to clean out such places. An orchard would seem to be a better place for the rearing of chicks since there they can have both shade and grass.

A Challenge Answered

I SAW a short piece in your February 17 issue that J. W. Squier had 58 pullets that laid 56½ dozen eggs in the month of December 1930, and he wanted to know who could beat it.

I have 15 Rhode Island Red pullets that I bought September 9, 1930, and they began to lay October 1. In the month of October they laid 166 eggs, November 223, December 317, January 276, and from February 1 to 8, 74. As I do not have a very good place to keep them, I think they have done well.—MARK E. CHANDLER, Mapleton, Maine.

I saw the item in your paper about the wonderful luck J. W. Squier had with his pullets, and he asks, "Who Can Beat It?"

I accept his challenge. I have 35 pullets, full-blooded black Leghorns, 8 months old, and in the month of December 1930 they laid 48 dozen and 9 eggs.

My henhouse is two piano boxes and the yard is 5 x 7. There is no heat or any improvement, in a small city back yard. They have never been out of the place since they were put in. The black Leghorns do not need fancy houses or fancy feed. They just keep on laying. I bought 50 and raised 48.—MRS. M. L. BRAMON, Poughkeepsie, N. Y.

I recently saw a little article in your paper of a man in Pennsylvania having 58 Partridge Rock pullets that laid 56½ dozen eggs in December 1930, and it said, "Who Can Beat It?"

Well, I think I can. I have 38 Rhode Island Red pullets, and in the month of January 1931 I got 42 dozen and 5 eggs.—HARRY I. NICKERSON, Dolgeville, N. Y.

Egg Factors Affecting Hatchability

THE factors that are most vital in the production of hatchable eggs are breeding, feeding and care of the eggs. The accumulation of a large number of small things often has a great deal to do with the final result of the hatching.

Experiments have proven that cross-breeding increases fertility and to in-breed, reduces both fertility and the hatchability of eggs. It is, therefore, essential that the male birds be carefully selected in respect to blood lines. Comfortably housed birds will produce a far higher percentage of fertile eggs than birds that are housed in buildings where the temperature is allowed to go too low.

The age, vigor, vitality and constitution of the birds are more important than the number of male birds in the flock.

Feeding: A well-balanced ration is necessary for best results. Vitamins and minerals are two important factors that must be taken into consideration in balancing a ration for producing eggs that have potential fertility and hatchability. An ample supply of rich, yellow corn, plenty of animal protein, clean fresh water, minerals and cod liver oil are necessary.

Care of the Eggs: Experiments show that the most favorable hatching period for eggs is under seven days and that for best results, eggs being held for incubation should not be subjected to a temperature of more than 68 degrees. Eggs must not be subjected to a freezing temperature as this also has disastrous results. Keep the eggs away from

FARM
MECHANIC

Removing Sludge from Lighting Batteries

SEVERAL readers have written us that parties have been working in their localities cleaning out the sludge in the bottom of farm light plant batteries and adding new electrolyte. then guaranteeing that the batteries will last five years longer.

It is hard to give general advice in cases of this kind without having more complete information about the men, about the type of work they do, the charges they make, and especially about this guarantee. Batteries that have been carefully operated for four or five years could be overhauled in this way and would be good for four or five years additional service, as I have known batteries to give good service for at least thirteen years. As ordinarily handled, however, most batteries would have to be completely overhauled, new positive plates put in, new separators, and new electrolyte, and even then you would need a cash bond behind a guarantee of five years additional service.

The safest thing in such cases is to consult the firm from whom you bought your battery as to whether they know these people and have found them honest and reliable in living up to their guarantee. The chances are that the dealer will do this overhauling just as cheaply as these traveling workers, and you know that any guarantee your dealer makes is likely to be relied upon.—I. W. Dickerson.

Grow the best chicks you've ever OWNED with this OATMEAL FEED

The chicks that live and grow are the ones that earn a profit for you. Give all the downy little fellows a real chance to develop into deep-bodied, regular layers or heavy, full-breasted meat birds by starting them on Ful-O-Pep Chick Starter. Every mouthful of this famous Quaker feed contains a scientific proportion of wholesome oatmeal, cod liver meal, cod liver oil, molasses, minerals, proteins and

selected grain products—all of the things chicks need for quick growing and sturdy development. After the first six weeks continue their oatmeal career with Ful-O-Pep Growing Mash. Feed it until the birds are ready for laying or market. A test will convince you that these balanced oatmeal feeds can work a marked improvement in the development of your flock. There's a Quaker Dealer near you. See him at once.

Avoid costly baby-chick ills and start building better layers and plumper meat birds by feeding Ful-O-Pep Chick Starter. Six weeks after hatching, change to Ful-O-Pep Growing Mash

When Tractor Burns Out Valves

THE most common cause of a tractor repeatedly burning out the valves is that they are set with too close a clearance between valve stem and push rods so that when the valves become hot and expand the valve is held open a trifle and lets the flame blow through. There should be a space of .020 inch between the valve stem and the push rod at its lowest point. If your mechanic has been adjusting closer than .020 inch, this may be the cause of the trouble.

Running with too late a spark or with too rich a mixture may cause the valves to burn, but these troubles will usually cause the tractor to overheat badly. Using too lean a mixture also is likely to burn the valves and this may not always show by the engine overheating. Where all the valves burn, it would almost have to be one of the above causes.—I. W. Dickerson.

Cause of Headlights Burning Out

WHEN headlight bulbs burn out entirely too quickly, the trouble is almost always a bad connection in the battery charging circuit, usually one or the other of the battery terminals or where the battery is grounded to the car frame. If one of these is loose or badly corroded, the resistance may become so high as to cut down almost to nothing the current which passes into the battery. This cuts down the effect of the third brush control and causes the generator voltage to rise and the extra current which this sends through the lamp filaments soon burns them out.—I. W. Dickerson.

Where it is at all possible, where the orchard is large, it pays to have filling stations for water in the orchard. Since the time over which each spray will be effective extends only four or five days, rapid and uninterrupted work is desirable, so hauling the sprayer back and forth between the trees and the pump or central tank wastes valuable time.

BABY CHICKS

Sieb's OVERSIZE Chicks BIG DISCOUNT

5¢ We want to do our share in helping the farmer and poultry raiser by giving them the greatest bargain we have ever offered. These chicks are all Sieb's very finest pure-bred OVERSIZE chicks. No second or third grade, but the kind we have bred and cultured for many years to grow larger, mature quicker and produce 200 eggs or more per hen. If there ever was a time when the poultry raiser needs more eggs and more pounds of meat per bird, it's now, and Sieb's OVERSIZE chicks should meet this emergency. Make every dollar count by raising Sieb's OVERSIZE chicks. They pay. We can ship you 100 or 10,000 of these fine chicks the day you want them. Send for catalog or order from this ad. 100% live prepaid delivery guaranteed.

the kitchen stove or furnace. For the sake of cleanliness and sanitation the cleaning of dirty eggs is certainly advisable. Iodine solution helps in sterilizing the outside of the egg. The main reason for discarding thin-shelled eggs when filling the hatching trays is the danger of their cracking since it is very rare that a cracked egg will hatch. There is also some relation between thin-shelled eggs and the proper storage of calcium.

Where Most of the Consumer's Dollar Goes

(Continued from Page 3)

as you see, breaking open the covers of a few boxes to make a good display."

"Are these goods sold right then?"

I wanted to know.

"No, very seldom. At about 4:30 or 4:45 A. M. the jobbers are allowed to come in and as they go down by the displays, they purchase for their day's needs. There is an advantage in the way the cars are spotted here on the piers since the jobber will select his goods from the best looking produce that is convenient."

"And do they buy a carload at a time?"

"Hardly, a carload is apt to be divided between twenty or thirty jobbers who make selections for their various needs. A jobber will buy say, twenty cases of oranges, twenty sacks of potatoes, maybe fifteen boxes of apples, lettuce, celery and other fruits and vegetables according to his customer's wants."

We spent two or three hours going up and down the lines of produce along the pier. Such places as North Rose, Adams Basin, and Webster, were represented by shipments of our own New York State apples.

Mr. Corson told us that 700 cars of produce could be handled on the piers every day. These must be sold by six o'clock in the morning since the housewife gets this produce in time for lunch. Three piers owned by the Pennsylvania Railroad cover a space of 10 acres.

About 8:30 A. M. we went up to the fruit auction rooms where uniform produce such as apples, oranges and grapefruit from Florida and California are sold. Here the auctioneer was rattling off something in a jargon impossible for the layman to understand but apparently meaning something to those who were wildly waving their auction books and yelling at the top of their voices throughout the room. In a very short time we were told by our guide that 5 carloads of fruit had been sold. I was very much impressed by the efficiency with which large

(Continued from Opposite Page)

quantities of the perishable fruit were handled.

"Do they pay cash?" I inquired. "No," he answered ruefully. "I certainly wish they did. A very, very small percentage do." He added, "A number pay in seven days and more pay in ten while with some it is even longer. We really assume some of the functions of a banker, since we pay for the products upon arrival or before, and we extend to the jobber better than two weeks' credit as a rule."

"You buy directly from the country shipper then?" I asked.

"No, very little. Almost all of our business is done on a commission basis in one of three ways. Either truck or express shipments handled here at the store, carlots handled at the produce terminal piers or through the auctions. We only use the auction for standard products such as oranges and grapefruit in our line," he added.

"How is this produce handled after you sell it?" I asked him.

"It is all trucked to various markets either here in Manhattan, or to Brooklyn, some, of course, going direct to the jobbers' regular customers. Trucking is our greatest evil, but no one has offered a better solution to the transportation problem as yet. A truckman will wait in line sometimes for hours before he can get to the pier and pick up his load from the various points. This means that a truckload is all a man can take in one day, since after leaving the pier, he must fight cross-town traffic to one of the jobber markets. It costs seventy per cent as much to truck a car of potatoes two miles to the Wallabout Market in Brooklyn as it does to ship the same car from Avoca, N. Y., to the pier."

I was learning new things fast as I had never thought of that particular angle.

"Do you make much money?" I asked hesitantly. "Upstate, you know, we are always hearing about the exorbitant profits of the New York produce merchants."

"I should say not: Our costs are terrific. Competition is keener every day, and we feel that if the business will break a little better than even, and we can make a decent salary, we are doing well. Why, we even pay some of our salesmen more than we take out of the firm as owners."

This was news to me, and I admitted as much. I've always heard that the produce men took all of the consumer's dollar and the farmer got a kick in the pants," I told him.

He laughed. "I suppose it does look that way to them," he said.

"Proper loading and grading is one thing the grower and shipper must

The Telephone Increases her egg and poultry Profits

A Bell System Advertisement

THE telephone is used by a farmer's wife near Orleans, Ind., to get the highest prices for eggs. At certain times the prices paid by dealers in her neighborhood vary as much as 15 cents a dozen. By telephoning to a number of them and discovering where the highest price is to be had, she frequently realizes an added weekly profit of \$2 or more. She also finds the telephone profitable in getting orders for eggs to be hatched, and in buying feed and supplies with the greatest saving of time and money.

The telephone also gives valuable aid in getting the highest prices for livestock, grain, fruit and vegetables through co-operative marketing associations or local markets. It can always be depended on to run errands about the countryside, make social engagements, order farm and household supplies and summon help in cases of accident or sickness.

The modern farm home has a telephone that serves well every day of the year, rain or shine.

Buy the Advertised Article!

You want to get full value for every dollar spent. That is natural—all of us do.

You will find it pays to buy standard, trademarked goods. Let The AMERICAN AGRICULTURIST advertising columns serve as your shopping guide. They contain the latest information regarding farm machinery, household helps, work, clothing and other merchandise of interest to farmers.

The American Agriculturist Advertisers Are Reliable

Post Your Farm And Keep Trespassers Off

WE unreservedly advise farmers to post their land. The signs we have prepared are worded to comply with Conservation Law.

Per Dozen	\$ 1.00
Per Fifty	3.50
Per Hundred	6.50
Per Thousand	60.00

Specially worded signs will be made up at slight additional cost. Names and addresses will be imprinted at \$2.00 for the first one hundred and \$1.00 for each additional one hundred.

These signs are made up of extra heavy cloth material that will withstand the severities of the weather.

To avoid loss of cash in mail, send check or money order with order.

AMERICAN AGRICULTURIST, 10 N. Cherry St., Poughkeepsie, N. Y.

Balance the Menu

Various Types of Food Have to be Included

BECAUSE of the drought in various parts of the country the past year, many families are minus their usual winter food supplies. This means that foodstuffs must be bought, and due to meager funds, there is a real danger that the family diet will not be properly balanced from the standpoint of health. The President's emergency committee with Dr. Lillian M. Gilbreth as chairman of the woman's division, asked the United States Bureau of

simple little white voile dresses, inexpensive indeed, but the necks and the sleeves were edged, each with a row of little pastel colored rosettes, lavender, blue, and pink, in pale shades. The rosettes were made of bits of colored voile about four inches long and an inch and a half wide, drawn into a rosette and finished with a yellow French knot. The result was two very "Frenchy" little frocks, charming in their simplicity.—A. B. S.

Attractive Spring Mode

3034

DRESS PATTERN NO. 3034 is typical of the spring mode with its pretty silk print set off by plain colors. The sleeves slightly puffed at the wrist, the graceful slenderness of the dress itself, and its low flare indicate it as one of the season's best styles. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42-inches bust measure. Size 36 requires 3 3/4 yards of 39-inch material, with 5/8 yard of 39-inch contrasting. PRICE 15c.

Sociable Shamrocks

A Game for the St. Patrick's Party

PROVIDE cardboard shamrocks, one for each guest. Write on each the name of a guest, and distribute them so that each boy has a shamrock bearing the name of a girl, and vice versa. Have also in readiness a pile of old magazines, scissors and paste. Seat the young folks round the table and announce that each guest must "blarney" the person whose shamrock is given him, not in words, but by cutting illustrations and pasting them on the shamrock, on the reverse side.

If Marjorie is a good cook, John may decorate her shamrock with pictures of food advertisements, while if Betty is a "snappy" dresser, fashion sketches may adorn her shamrock. In the same way, Bob's shamrock may be ornamented with golf club illustrations, and Bert's with tools, if he has mechanical skill. The shamrocks are afterwards pinned round the room as an exhibit.—E. D. Y.

Smart Junior Dress

3020

DRESS PATTERN NO. 3020 can be made up delightfully in rather vivid blue tones of plaided rayon crepe with a capelet collar in plain silk. Pique, gingham, shantung and novelty cottons may be used for this frock. Velvet bows of darker blue are used to set off the front of the dress. The pattern cuts in sizes 8, 10, 12 and 14 years. Size 8 takes but 2 1/2 yards of 35-inch material with 3/8 yard of 35-inch contrasting. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. Add 12c for one of the spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

Tested Recipes

Crab Meat in Cases

BAKE a half dozen small biscuits and remove soft inner portion, after cutting slice from top. Melt three tablespoonfuls butter, add one tablespoonful chopped onion, a few grains of cayenne and mustard and a bit of grated nutmeg. Brown the onions and add two cupfuls hot thin cream and three tablespoonfuls flour and cook until sauce thickens. Add beaten yolks of two eggs and remove from fire immediately. Heat two cupfuls crab meat in double boiler, stir into the hot sauce, pour into the biscuit shells and serve.

Salmon With Carrots

Open small can of pink salmon and remove all bones and skin. Cook six medium sized carrots, and let stand in weak vinegar for one hour. Drain and chop carrots, add the fish, two hard boiled eggs chopped fine, a seasoning

FELT CUT-OUT PILLOW NO. B1460 comes stamped on black felt to be cut out, requiring no embroidery. White rayon underlay is also included for forming a contrasting background for the silhouette figures. Price, 85c. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

of salt and pepper and a slice of lemon broken in small pieces. Heat in double boiler and serve in hot dish.

Sardines With Rice

Open can of sardines and remove bones. To two cupfuls cooked rice add a seasoning of salt, pepper and mustard, one half cupful tomato catsup and one teaspoonful chopped onion. Put in pan and heat. Turn rice into hot serving dish, arrange sardines over the top and serve.

Tuna Fish Salad

Make a lemon jelly and set aside to cool. Look over can of tuna fish, removing any skin or fat and break into small pieces. Pour fish into jelly when it begins to set and let stand five or six hours. Arrange lettuce leaves on plate, cut salad into squares and pile these over it. Dress with a mayonnaise or whipped cream and French dressing.—L. M. T.

How to Grow Boxwood

"Can you give me some information about propagating and growing boxwood?"

BOXWOOD has a good root system and can be planted out in spring or fall.

I copy from Bailey's Cyclopaedia on propagation. "Propagation is by cuttings from mature wood early in fall, kept during the winter in the cool greenhouse or under handlights in the open; in more temperate regions they may be inserted in a shady place in the open air; four or six inches is the best size for outdoor cuttings. Layers will also make good plants. Seeds are sown soon after maturity, but it requires a long time to raise plants of good size from them."

It is also possible to make good cuttings of the growing but partly mature growths in July. Insert in sand in a cool greenhouse or shaded frame and do not let dry out. Take the growth of the season a few inches, cut below a node (just below) cut off a few lower leaves, and insert for about an inch in trenches cut in the sand, then firm in hard and water.—L. A. M.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

SO MANY WOMEN SAY

"FELS-NAPTHA IS A REAL

WASHING BARGAIN"

AND the women who say that are the women who *know*! They use Fels-Naptha! They have seen for themselves that it gives real washing value. Not more bars, but more help! *Extra* help that makes washing easier. *Extra* help they could hardly expect from any other laundry product—regardless of form, color or price.

Why does Fels-Naptha give this *extra* help? Because every big golden bar brings you *two* cleaners. Plenty of grease-dissolving naptha and good golden soap. You can smell the naptha! Working together, the soap and naptha make a busy team—a team that removes even stubborn dirt and gives you that fresh, airy-sweetness of thoroughly clean clothes without hard rubbing.

Fels-Naptha works so quickly that you get your hands out of water sooner. And each bar contains soothing glycer-

ine, which helps keep them nice. Try Fels-Naptha in tub or machine; for soaking or boiling; in hot, lukewarm or cool water. Try it for general cleaning, too. And let its *extra* help prove to you that Fels-Naptha is a real wash-day bargain. Your grocer sells it!

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-3-14, Fels & Company, Philadelphia, Pa.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

David cannot understand why his Lady of the Roses and Jack are not on good terms. His Lady tells him that none of her hours are happy ones, and when David tells this to Mr. Jack it seems to start him thinking.

David is apparently going to make the situation either worse or better by repeating to his Lady of the Roses the story about the Princess and the Pauper which Jack told him.

When David fails to visit Jack and Jill and his "Lady of the Roses" for a week, they make inquiry and discover that David is dangerously ill.

.....

"'Course, there's you an' Miss Holbrook, always askin' an' sendin' things—but that ain't so strange, 'cause you was 'specially his friends. But it's them others what beats me. Why, some days it's 'most ev'ry soul I meet, jest askin' how he is, an' sayin' they hopes he'll git well. Sometimes it's kids that he's played to, an' I'll be jiggered if one of 'em one day didn't have no excuse to offer except that David had fit him—'bout a cat, or somethin'—an' that ever since then he'd thought a heap of him—though he guessed David didn't know it. Listen ter that, will ye!"

"An' once a woman held me up, an' took on turrible, but all I could git from her was that he'd sat on her doorstep an' played ter her baby once or twice;—as if that was anythin'! But one of the derndest funny ones was the woman who said she could wash her dishes a sight easier after she'd a-seen him go by playin'. There was Bill Dowd, too. You know he really has got a screw loose in his head somewheres, an' there ain't any one but what says he's the town fool, all right. Well, what do ye think he said?"

Mr. Jack shook his head.

"Well, he said he did hope as how nothin' would happen ter that boy, 'cause he did so like ter see him smile, an' that he always did smile every time he met him! There, what do ye think o' that?"

"Well, I think, Perry," returned Mr. Jack soberly, "that Bill Dowd wasn't playing the fool, when he said that, quite so much as he sometimes is, perhaps."

"Hm-m, maybe not," murmured Perry Larson perplexedly. "Still, I'm free ter say I do think 't was kind 'o queer." He paused, then slapped his knee suddenly. "Say, did I tell ye about Streeter—Old Bill Streeter an' the pear tree?"

Again Mr. Jack shook his head.

"Well, then, I'm goin' to," declared the other, with gleeful emphasis. "An', say, I don't believe even *you* can explain this—I don't! Well, you know Streeter—ev'ry one does, so I ain't sayin' nothin' sland'rous. He was cut on a bias, an' that bias runs ter money every time. You know as well as I do that the won't lift his finger unless there's a dollar stickin' to it, an' that he hain't no use fur anythin' nor anybody unless there's money in it for him. I'm blamed if I don't think that if he ever gits ter heaven, he'll pluck his own wings an' sell the feathers fur what they'll bring."

"Oh, Perry!" remonstrated Mr. Jack, in a half-stifled voice.

Perry Larson only grinned and went on imperturbably.

"Well, seein' as we both understand what he is, I'll tell ye what he *done*. He called me up ter his fence one day, big as life, an' says he, 'How's the boy?' An' you could 'a' knocked me down with a feather. Streeter—a-askin' how a boy was that was sick! An' he seemed ter care, too. I hain't seen him look so long-faced since—since he was paid up on a sartin note I knows of, jest as he was smackin' his lips over a nice fat farm that was comin' to him!"

"Well, I was that plum puzzled that I meant ter find out why Streeter was takin' sech notice, if I hung fur it. So I set to on a little detective work of my own, knowin', of course, that 'twa'n't no use askin' of him himself. Well, an' what do you s'pose I found out? If that little scamp of a boy hadn't even got round him—Streeter, the skinflint! He had—an' he went there often, the neighbors said; an' Streeter doted on him. They declared that actually he give him a cent once—though *that* part I ain't swallerin' yet."

"They said—the neighbors did—that it all started from the pear tree—that big one ter the left of his house. Maybe you remember it. Well, anyhow, it seems that it's old, an' through bearin' any fruit, though it still blossoms fit ter kill, every year, only a little late 'most always, an' the blossoms stay on longer'n common, as if they knew there wa'n't nothin' doin' later. Well, old Streeter said it had got ter come down. I reckon he suspected it of swipin' some of the sunshine, or maybe a little rain that belonged ter the tree t' other side of the road what did bear fruit an' was worth somethin'! Anyhow, he got his man an' his axe, an' was plum ready ter start in when he sees David an' David sees him."

"'T was when the boy first come. He'd gone ter walk an' had struck this pear tree, all in bloom,—an' 'course, *you* know how the boy would act—a pear tree, bloomin', is a likely sight, I'll own. He danced and laughed and clapped his hands,—he didn't have his fiddle with him,—an' carried on like all possessed. Then he sees the man with the axe, an' Streeter; an' Streeter sees him."

"They said it was rich then—Bill Warner heard it all from t'other side of the fence. He said that David, when he found out what was goin' ter happen, went crazy, an' rampaged on at such a rate that old Streeter couldn't do nothin' but stand an' stare, until he finally managed ter growl out: 'But I tell ye, boy, the tree ain't no use no more!'"

"Bill says the boy flew all to pieces then. 'No use—no use!' he cries; 'such a perfectly beautiful thing as that no use! Why, it don't have ter be any use when it's so pretty. It's jest ter look at an' love, an' be happy with!' Fancy sayin' that ter old Streeter! I'd like ter seen his face. But Bill says that wa'n't half what the boy said. He declared that 't was God's present, anyhow, that trees was; an' that the things He give us ter look at was jest as much use as the things He give us ter eat; an' that the stars an' the sunsets an' the snowflakes an' the little white cloud-boats, an' I don't know what-all, was jest as important in the Orchestra of Life as turnips an' squashes. An' then, Billy says, he ended by jest flingin' himself on ter Streeter an' beggin' him ter wait till he could go back an' git his fiddle so he could *tell* him what a beautiful thing that tree was."

"Well, if you'll believe it, old Streeter was so plum befuzzled he sent the man an' the axe away—an' that tree's a-livin' ter-day—t' is!" he finished; then, with a sudden gloom on his face, Larson added, huskily: "An' I only

hope I'll be sayin' the same thing of that boy—come next month at this time!"

"We'll hope you will," sighed the other fervently.

And so one by one the days passed, while the whole town waited and while in the great airy "parlor bedroom" of the Holly farmhouse one small boy fought his battle for life. Then came the blackest day and night of all when the town could only wait and watch—it had lost its hope; when the doctors shook their heads and refused to meet Mrs. Holly's eyes; when the pulse in the slim wrist outside the coverlet played hide-and-seek with the cool, peristent fingers that sought so earnestly for it; when Perry Larson sat for uncounted sleepless hours by the kitchen stove, and fearfully listened for a step crossing the hallway; when Mr. Jack on his porch, and Miss Holbrook in her tower window, went with David down into the dark valley, and came so near the rushing river that life, with its petty prides and prejudices, could never seem quite the same to them again.

Then, after that blackest day and night, came the dawn—as the dawns do come after the blackest of days and nights. In the slender wrist outside the coverlet the pulse gained and steadied. On the forehead beneath the nurse's fingers, a moisture came. The doctors nodded their heads now, and looked every one straight in the eye. "He will live," they said. "The crisis is passed." Out by the kitchen stove Perry Larson heard the step cross the hall and sprang upright; but at the first glimpse of Mrs. Holly's tear-wet, yet radiant face, he collapsed limply.

"Gosh!" he muttered. "Say, do you know, I didn't s'pose I did care so much! I reckon I'll go an' tell Mr. Jack. He'll want ter hear."

CHAPTER XXIII

PUZZLES

DAVID'S convalescence was picturesque, in a way. As soon as he was able, like a king he sat upon his throne and received his subjects; and a very gracious king he was, indeed. His room overflowed with flowers and fruit, and his bed quite groaned with the toys and books and games brought for his diversion, each one of which he hailed with delight, from Miss Holbrook's sumptuously bound "Waverley Novels" to little crippled Jimmy Clark's bag of marbles.

Only two things puzzled David: one was why everybody was so good to him; and the other was why he never could have the pleasure of both Mr. Jack's and Miss Holbrook's company at the same time.

David discovered this last curious circumstance concerning Mr. Jack and Miss Holbrook very early in his convalescence. It was on the second afternoon that Mr. Jack had been admitted to the sick-room. David had been hearing all the latest news of Jill and Joe, when suddenly he noticed an odd change come to his visitor's face.

The windows of the Holly "parlor bedroom" commanded a fine view of the road, and it was toward one of these windows that Mr. Jack's eyes were directed. David, sitting up in bed, saw then that down the road was approaching very swiftly a handsome span of black horses and an open carriage which he had come to recognize as belonging to Miss Holbrook. He watched it eagerly now till he saw the horses turn in at the Holly driveway. Then he gave a low cry of delight.

"It's my Lady of the Roses! She's coming to see me. Look! Oh, I'm so glad! Now you'll see her, and just *know* how lovely she is. Why, Mr. Jack, you aren't going *now*!" he broke off in

manifest disappointment, as Mr. Jack leaped to his feet.

"I think I'll have to, if you don't mind, David," returned the man, an oddly nervous haste in his manner. "And you *won't* mind, now that you'll have Miss Holbrook. I want to speak to Larson. I saw him in the field out there a minute ago. And I guess I'll slip right through this window here, too, David. I don't want to lose him; and I can catch him quicker this way than any other," he finished, throwing up the sash.

"Oh, but Mr. Jack, please just wait a minute," begged David. "I wanted you to see my Lady of the Roses, and—" But Mr. Jack was already on the ground outside the low window, and the next minute, with a merry nod and smile, he had pulled the sash down after him and was hurrying away.

Almost at once, then, Miss Holbrook appeared at the bedroom door.

"Mrs. Holly said I was to walk right in, David, so here I am," she began, in a cherry voice. "Oh, you're looking lots better than when I saw you Monday, young man!"

"I am better," caroled David; "and to-day I'm 'specially better, because Mr. Jack has been here."

"Oh, has Mr. Jack been to see you to-day?" There was an indefinable change in Miss Holbrook's voice.

"Yes, right now. Why, he was here when you were driving into the yard."

Miss Holbrook gave a perceptible start and looked about her a little wildly.

"Here when—But I didn't meet him anywhere—in the hall."

"He didn't go through the hall," laughed David gleefully. "He went right through that window there."

"The window!" An angry flush mounted to Miss Holbrook's forehead. "Indeed, did he have to resort to that to escape—" She bit her lip and stopped abruptly.

David's eyes widened a little.

"Escape? Oh, *he* wasn't the one that was escaping. It was Perry. Mr. Jack was afraid he'd lose him. He saw him out the window there, right after he'd seen you, and he said he wanted to speak to him and he was afraid he'd get away. So he jumped right through that window there. See?"

"Oh, yes, I—see," murmured Miss Holbrook, in a voice David thought was a little queer.

"I wanted him to stay," frowned David uncertainly. "I wanted him to see you."

"Dear me, David, I hope you didn't tell him so."

"Oh, yes, I did. But he couldn't stay, even then. You see, he wanted to catch Perry Larson."

"I've no doubt of it," retorted Miss Holbrook, with so much emphasis that David again looked at her with a slightly disturbed frown.

"But he'll come again soon, I'm sure, and then maybe you'll be here, too. I do so want him to see you, Lady of the Roses!"

"Nonsense, David!" laughed Miss Holbrook a little nervously. "Mr.—Mr. Gurnsey doesn't want to see me. He's seen me dozens of times."

"Oh, yes, he told me he'd seen you long ago," nodded David gravely; "but he didn't act as if he remembered it much."

"Didn't he, indeed!" laughed Miss Holbrook, again flushing a little. "Well, I'm sure, dear, we wouldn't want to tax the poor gentleman's memory too much, you know. Come, suppose you see what I've brought you," she finished gayly.

"Oh, what is it?" cried David, as, under Miss Holbrook's swift fingers, the wrappings fell away and disclosed

Just David

(Continued from Opposite Page)

a box with quantities of oddly shaped bits of pictured wood—a jumble of confusion.

"It's a jig-saw puzzle, David. All these little pieces fitted together make a picture, you see. I tried last night and I couldn't do it. I brought it down to see if you could."

"Oh, thank you! I'd love to," rejoiced the boy. And in the fascination of the marvel of finding one fantastic bit that fitted another, David apparently forgot all about Mr. Jack—which seemed not unpleasant to his Lady of the Roses.

It was not until nearly a week later that David had his wish of seeing his Mr. Jack and his Lady of the Roses meet at his bedside. It was the day Miss Holbrook brought to him the wonderful set of handsomely bound "Waverley Novels." He was still glorying in his new possession, in fact, when Mr. Jack appeared suddenly in the doorway.

"Hullo, my boy, I just—Oh, I beg your pardon. I supposed you were—alone," he stammered, looking very red indeed.

"He is—that is, he will be, soon—except for you, Mr. Gurnsey," smiled Miss Holbrook, very brightly. She was already on her feet.

"No, no, I beg of you," stammered Mr. Jack, growing still more red. "Don't let me drive—that is, I mean, don't go, please. I didn't know. I had no warning—I didn't see—Your carriage was not at the door to-day."

Miss Holbrook's eyebrows rose the fraction of an inch.

"I sent it home. I am planning to walk back. I have several calls to make on the way; and it's high time I was starting. Good-bye, David."

"But, Lady, of the Roses, please, please, don't go," besought David, who had been looking from one to the other in worried dismay. "Why, you've just come!"

But neither coaxing nor argument availed; and before David really knew just what had happened, he found himself alone with Mr. Jack.

(Continued Next Week)

HANDY ANDY Says "Here's How"

To Grow Quality Corn:

By Ray Inman

TO GROW QUALITY CORN:

1. Build up soil fertility.
2. Grow types that will mature...
3. Use disease-resistant seed.
4. Store corn in cribs which protect it from weather & let it dry quickly....
5. Don't shell corn when wet
6. Don't ship mixed cars of white and yellow corn.....

"HOW TO BUILD SOIL FERTILITY?"—THAT'S THE QUESTION, AND WE PUT IT TO SOME OF OUR MOST NOTORIOUS FRIENDS. THEY REPLIED:

FURNIFOLD T. WAFER:
"I ALLUS BUILD IT IN AN ICE NEAT PILE OUTSIDE MY BARN DOOR"

SOZIER OLMAN:
"ME? BUILD SOIL FER TILLY? IF I BUILD IT FER ANYBODY I'LL BUILD IT FER MYSELF."

ANDREW P. ANDIRON:
"YOU DONT BUILD IT, SILLY, YOU SPREAD IT ON THE GROUND."

HANIBAL K. HAYWIRE:
"I GOT BUILDINGS ALL OVER THE PLACE. IF I BUILD ANYTHING MORE I WONT HAVE ROOM TO GROW CORN."

DID YOU CALL ME, MR. MUFFIN?

YOU BET I DID, DOC. I WANT YOU SHOULD VACCINATE MY SEED CORN AGAINST SMALL POX AN' TYPHOID FEVER.

HEY, STUPID! DIDN'T I TELL YOU NEVER TO SHELL CORN WHEN WET?

NOW DONT YOU GO WORRYIN' ABOUT ME, BOSS. I AINT AFRAID O' CATCHIN' COLD. BESIDES, I AINT SO VERY WET.

A Page of Letters from A.A. Readers

A Sense of Values

THE experiences of life have taught me that the pursuit of happiness is a series of "free-for-all" contests. We may make as many entries as we choose; we will win the prizes we have earned. The sum total each receives will be in proportion to the mental, moral or physical ingredients each contributed toward achievement. If we would reap happiness out of life, let us sow seeds, productive of joy, in our manner of living.

Much of the unhappiness of life is caused by a mistaken sense of values. We pay too much, or perhaps too little, for the things we acquire. Most of us lack the ability to appreciate the true worth of things at the present time or in the future, when all costs are reckoned. A flawless diamond is worthless to a starving man in a snow-bound forest. But, oh—a smile, a tear, a glowing sunset, a faded flower, or a stammered word, how rich are we in their possession at certain of life's moments.

Surely no one need remain unhappy long in this grand old world, where so much was created for our enjoyment! If we cannot have what we want, let us want *what we can have!*

Home, relatives, sincere friends, a fondness for good reading, and a deep reverence for the Creator of All Things, have been my enduring satisfactions in life. The one thing which has given me the utmost joy in living has been to scatter a little brightness in the lives of others.

When life was dark and drear to me, I found solace in the country, for there, near to Nature's heart, I have learned many of life's most valuable and most interesting lessons.

I long ago discovered:—

*"Our lives are songs; God writes the words
And we set them to music at leisure
And the song grows glad, or sweet or sad
As we choose to fashion the measure.*

*We must write the music whatever the song,
Whatever its rhyme or meter:
And if it is glad, we may make it sad,
Or if sweet, we may make it sweeter."*

—AGNES E. PRUNIER,
Pearleeville, New York

"— & Son"

By EARL P. ROBINSON,
New Hampshire County Agent Leader

THIS is not a "keep the boy on the farm" plea. It is rather a challenge to farm people to see that the boys who do stay on the farm are given every possible opportunity to fit themselves for successful farming. Farm people put great emphasis upon the value of experience. And the assumption generally is that a boy brought up on a farm has had the experience to fit him for managing a farm. But that is not necessarily true. Many sons get plenty of experience as farm laborers and practically none in responsibilities of management.

It's a different matter upon a certain large potato farm where this bit of dialogue took place recently between the County Agent and the farm owner. Said the County Agent, "John, why don't you enter that field for certification?" And John came back with this, "Well, maybe we will—I want to talk it over with Son first—we'll let you know what we decide."

Real Partners

And at a dairy farm where a visitor inquired as to the production of individual cows, the father said, "Wait, I'll call Harry, he keeps the records and can tell you better than I can how our cows stand."

A certain distinguished farm leader of today when just a youngster of 15

was sent by his father, an invalid, to an auction sale to buy hay. Hay sold at a high figure and the boy did not succeed in getting any, but one of the fine, purebred heifers aroused his enthusiasm to such a high pitch that before he knew it he had outbid the man and found himself the owner of it. However, when he arrived home long after dark leading the heifer through the snow he was not reprimanded for his independence. It would be a wholesome lesson for parents today to know how much of the credit for high achievement of this distinguished farm leader belongs to the father who knew how to give meaning in every-day activities to that phrase, ".....& Son."

There is so very much to farming besides plowing, cultivating, reaping, feeding and milking. All farm boys are given experience in these tasks. Some of the boys acquire great skill in one or more of them. But those other responsibilities of a farmer the what, how, when and where of buying machinery and supplies, the how, when, where of selling the products of the farm, the financing of the business, are all of paramount importance, from the standpoint of managing a farm. Few farm boys get experience along these management lines until they start farming for themselves.

Requirements for Success Are High

Never in the history of the world have the requirements for success in farming been so high as today. And with every passing decade it becomes more difficult to qualify as a successful farmer. The boy who, in addition to skill in the manual arts, also has had practice—in association with his father—in buying, selling, planning, managing, stands a far better chance of success when he goes out "on his own" than does the lad who simply has had practice as a farm laborer.

Whether the barn carries in showy letters, ".....& Son" or not, there should at least be that degree of partnership in problems of management that will give the boy real training in this most difficult phase of farming.

A Farmer Talks

WHEN I was fifteen years of age, I went to work on a farm for fifteen dollars per month. My cousin in Mt. Vernon, Ohio, was a handsome young fellow, a skilled mechanic, making at the same time in town four dollars per night, twenty-four dollars per week. It looked like an awful lot of money to me.

I worked for fifteen dollars per month on different farms till I was twenty years of age. I often wished I could make money as fast as my cousin did.

In the five years he earned and received \$5220.00. In these same five

years, getting fifteen dollars per month for eight months in the year I had earned and received \$600.00.

I managed to save enough to buy a team of cheap horses, a wagon and some farming implements at a sale. I married and started out farming on the shares. My cousin got married about the same time I did.

After I had farmed on the shares for a number of years, I saved enough money to make a down payment on this farm of seventy acres with good buildings.

I have been living on this farm for twelve years. I owe \$800.00 yet and this year's crops will pay me out. I am now forty-five years old.

My cousin in Mt. Vernon has handled ten times as much money as I have handled but it took it all to live. He is forty-eight years old and is living in the same rented house he moved into when he was married.

—R. H. GWINNER.

The Best Book in the Library

WHEN the writer's father was marching to the Sea with Sherman, the most interesting book in the scant library on the Iowa farm was a bound volume of the American Agriculturist, for the year of 1863.

I was then a boy under five years of age. Though the binding was from a paper flour sack, 4X Best Family, it is

Where Most of the Consumer's Dollar Goes

(Continued from Page 17)

learn if New York State produce is to compete with that of California, Maine, Colorado and other states, where grading standards are enforced and the receiver is assured of a uniform pack. We would handle a great deal more state produce if we knew we would get a standard quality product."

"But aren't our vegetables as good as any?"

"Yes, in some cases. But when we hardly ever find one car the same as the next, and with poor quality potatoes mixed with the good, it is too great a gamble, considering the competition we meet, and the quality demanded, by the trade.

After leaving the fruit auction, we took a walk up Washington Street, the world's largest wholesale market. Trucks going this way and that, missing each other by inches, tore through the narrow cobbled streets, seemingly headed nowhere in particular but terribly in a hurry to get there. The sidewalks were piled to the curb with fruits and vegetables of all kinds. In fact, there seemed to be no order or system to anything.

We were then taken across the city through the morning traffic to Wall-

still in good condition and looking it over the other day, the illustrations were familiar to me, and recalled the many hours I spent looking at them back in 1864 and 1865.

I wonder how many still have older copies than 1863?—C. W. C., Iowa.

EDITOR'S NOTE—We have in our files in the A. A. office, at least one copy of every issue of American Agriculturist that was ever published, from the time it was started in 1842. We find nothing more interesting than studying these old volumes. The editors and contributors wrote well in the old days and it is a privilege to be connected with a publication that has stood for such high standards in American country life for so long.

A.A. Advertisers Guaranteed

I am an A. A. subscriber and hesitate to ask this favor of you, for I know this company does not advertise in your paper. Or I never saw this advertisement, at least.

WE are always more than glad to help our subscribers in any possible way. As a matter of fact, the very great majority of the claims concern firms that do not advertise in American Agriculturist. Because of the fact that we guarantee all advertising, and investigate them carefully before admitting them to our columns, subscribers do not often find it necessary to send us any complaints about them.

about Market in Brooklyn. Here produce had been trucked over the piers we had just visited and sold in competition with that brought in by the farmers from Long Island. Every farmer has a stall from which he sells direct to the jobber and to the small speculator who buys and sells, hoping to make a profit from day to day. These speculators are an important factor in the crowded market. I noticed in the stores that we went through that produce was handled in much smaller lots than it was before and I had the good fortune to meet Mr. Kennedy who is in the wholesale receiving business but is also a jobber of the better class.

Mr. Kennedy, a short, stocky man, seemed all business, and I could hardly get a word out when he would start telling me of some new angle.

"Jobbers as a rule depend entirely on the wholesale receiver for their supplies," he explained. "They buy at the piers and the produce is either carried in their own or in a transit company's truck to one of the jobber markets."

"And the retailer buys from you direct at the market?" I concluded.

"In most cases, yes. The retailer will order in small lots as he must have a wide selection to meet the needs of his trade. He may buy from several jobbers, all of whom must make a delivery to the retailer's place of business. It is the necessity of having to deliver before eight o'clock in the morning so the retailer may serve the housewife, that causes the trucking congestion and so raises the cost of handling perishable products. There is no money in the jobbing game any more," he said, with a deprecating gesture. "Some jobbers run on their wholesale credit, hoping to get their pay from the retailer before their wholesale debts come due. It is such competition, along with the other factors that makes the average produce man greyheaded so early."

It was with a new conception of New York's markets that I started uptown that evening. The trucks, that in the morning had seemed to have no place in particular to go, were headed on an understandable errand. Dusk was falling and lights were beginning to twinkle across the Hudson. Tugs with their laden barges moved slowly down towards the piers. Now, to me, they were a link in that great chain that gives the New York housewife fresh fruits and vegetables for her table.

So Near---and Yet So Far!

I am in a contest—the Hollywood Marvel Products Company of Hollywood, California. It closed December 31, 1930. I lacked only one point of winning first prize; have my certificates, points; and also their letter. I have not heard a word from them. Have they the right to send such stuff through the United States mail and then not pay me anything? I was in the Marvel Puzzle Path contest, sold some goods for them, and sent them their \$10. I worked hard to win. Don't you think they should give me at least second prize?

We frequently comment on easy puzzle schemes. The following warning which comes from the National Better Business Bureau is timely and to the point:

"Don't be puzzled if the puzzle you have solved fails to win you a Shetland pony, an automobile, a 6-room house or even a five dollar bill."

This is the advice of the National Better Business Bureau in answering an increasing number of complaints from children and adults all over the country who have correctly solved "come-on" puzzles, but have failed to win prizes.

It is not until after the puzzle has been solved, the Bureau states, that many participants have learned they have been awarded nothing but a certain number of points and that, before the prizes, if any, are distributed, it will be necessary to earn additional points by securing magazine subscriptions or by selling merchandise.

A wave of deceptive puzzle contest advertisements, according to the Bureau, is sweeping through newspaper and magazine pages and inducing thousands of children and adults to attempt to get something for nothing. Although the advertisements hold out fortunes to those who can find the twins, take the car out of the labyrinth or perform any of the dozen or more favorite feats, the winning of the prizes is generally a far more difficult matter than promoters lead contestants to believe. In a contest which terminated a year ago it was disclosed that one participant, who amassed the imposing total of 2,190,000 votes, representing 468 magazine subscriptions, failed to qualify for any of the 20 prizes offered.

Postal authorities have been unable to ban such puzzle contests as a violation of the lottery laws, since, as the promoters claim, the element of chance is missing. The final awards, they say, are based on skill and energy in securing sales.

Will Replace at Half Price

I am writing to find out if you can recommend the Adams Paint Company of Cleveland, Ohio. G. W. M., New York.

Last July an agent of the Madison Paint Company sold me some roofing paint. It was applied and in thirty days it had practically all washed off the roof. Both the agent and the painter that put it on say that it was absolutely the worst and most worthless lot of material they ever saw. I wrote to the company and they agree to send another drum of the stuff at half price. I am not interested in that kind of an adjustment.—W. L. W., New York.

BOTH the Adams Paint Company and the Madison Paint Company, we are informed are subsidiaries of the Acorn Refining Company of Cleveland, Ohio. Other subsidiaries are, the Fulton Paint Company and the Franklin Paint Company, about which we have previously commented. For a long time we referred complaints to them but we have about given up because as far as we can remember we have never been able to settle any complaint in a manner entirely satisfactory to our subscribers.

As we remember, actual refunds have never been given. These companies in some cases offer to replace the paint at a reduced price, and in some cases at no cost, but many subscribers, after their first experience, are not satisfied to accept such an adjustment. Sometimes subscribers have sent the paint back but the company usually refuses it, puts it in

storage, theoretically at the cost of the subscriber, and continues to attempt to collect pay for it.

We, of course, cannot claim to be judges as to the quality of the paint and can only repeat what our subscribers have told us.

A Chance to Help

I am interested in finding a young man who is going to high school now, who is willing to become interested in going to college and studying veterinary medicine. One with good personality is preferred. I have a good proposition to offer the right young fellow. Let's hear from the boys in high school.—Write Dr. R. E. O. c/o American Agriculturist, 461 4th Ave., New York City.

I have a boy of eleven years of age. He is an honest boy and willing, and is a lover of dumb animals. I would like to find a good home for him. Would consider adoption, if it were where he would have a good home and also get an education. If anyone knows of a person who wants a boy, kindly write to C. A. E. c/o American Agriculturist, 461 4th Ave., New York City.

What's In a Name?

SOME time ago we called the attention of our subscribers to the fact that the New England Commission Company, which has been soliciting shipments from our subscribers, is not a commission company, and that it is not licensed and bonded with the State Department of Agriculture and Markets. The law requires that every firm that sells on commission must be licensed and bonded, but a direct buyer, that is, a man who simply buys his stuff and pays for it, is not required by law to be licensed and bonded.

There have been claims in some quarters that Joseph C. Berman is connected with the New England Commission Company. He, we understand, maintains that he is merely acting as an employee to this firm. However

that may be, many subscribers will remember that Joseph C. Berman had his license as a commission man revoked some time ago and that he went out of business owing shippers such a large sum that the bond which he took out with the State Department of

We Are Glad to Help

At this time I wish to thank you for your service in securing a satisfactory settlement against.....

The collector came last Tuesday and I was able to straighten things up with them, I had been for over six months trying to get them to settle, but after writing to you the collector settled within three weeks.

I will recommend your paper and Service Bureau to all my friends.

* * *

I have received the money from..... and I want to thank you many times for your kind cooperation. I never would have got my money if it hadn't been for your Service Bureau. The best way I can thank you again is to say that I am glad to stick to your insurance policy, and also that I am now getting others to take your policy.

I have already three subscribers and am trying to get more. I think I can all right. I never thought you would get this money for me.

* * *

I wish to inform you that my claim has been settled in full. The amount involved in this case was small but would have amounted to quite a little if it had been repeated for any length of time.

I wish to thank you very much for your prompt action in this matter. You are certainly rendering your subscribers a great service worth many times the cost of your paper.

Agriculture and Markets failed to cover the entire indebtedness.

Recently we received several letters from subscribers stating that they have not received returns promptly for eggs sent to the New England Commission Company. We are giving you these facts for your information and protection.

What Is the Sale Value?

Recently a concern by the name of the Standard Oil Company of Colorado came out with an offering of stock in a com-

pany just forming. The stock sold for \$10.00 a share and I bought ten shares. I thought it was the original Standard Oil Company. I was about to purchase ten more, but decided I had better investigate. I sent a telegram to the Standard Oil Company of New York, and they wired back that the Standard Oil Company of Colorado was in no way connected with any of the regular Standard Oil Companies. I am wondering if there is any way to get my money back.

WE checked our subscriber's letter with the Standard Oil Company of New York who replied that the Standard Oil Company of Colorado is not affiliated with or connected in any way with their company, nor is it a subsidiary of any of the Standard Oil Companies whose stock is distributed by reason of the dissolution of the old Standard Oil Trust.

We of course cannot pass on the value of the stock but we can point out that persons who buy stock cannot get their money back except by the sale of it on the open market. Our subscriber ought to be able to find the value of the securities very quickly by trying to sell them.

Dorothy Adams Again!

ABOUT a year ago we ran several stories about Dorothy Adams, whose real name was Ralph Boyd, and who advertised all over our territory saying that she was selling radios. It developed that these were used radios and the Post Office Department issued a fraud order preventing Mr. Boyd from continuing with his business. Middlesex County authorities also interested themselves in the matter and the case was presented to the grand jury. However, it was felt that there were not sufficient grounds for criminal action because there was no record of Boyd having advertised in Middlesex County.

It appears at this time that there was little chance of anyone securing return of the money that was sent to Dorothy Adams because of the small sums that were sent in each particular case. Anyone who sent money could, of course, take legal action against Mr. Boyd but it would probably cost more than he would get out of it.

Joseph Kaufman Out of Business

SOME time ago we called attention to complaints of subscribers against D. A. Fassburg, who, our subscribers claimed, was soliciting shipments on the stationery of Joseph Kaufman. We mention this now only to give you some additional information.

We have just learned that Joseph Kaufman of West Washington Market, who had a commission merchant's license for the year 1930-31, incorporated last August and therefore his commission license as an individual became void. He did not renew this license, saying that he intended to seek shipments on consignment. Recently his place of business closed up.

Naturally, shippers will not want to send stuff to his former address as there might be some question as to how it would be disposed of. Our information is that he does not have a commission merchant's license, and there will, of course, be no chance of getting payment for goods shipped, under the bond which he had up to the time he discontinued doing business as a commission merchant.

Avoid Sending Cash Through the Mail

There is always some danger that money will be lost when it is sent through the mail. This is particularly true of coins. May we, therefore suggest that when you have occasion to send money to American Agriculturist, either for subscriptions, patterns, embroidery, trespassing notices, or insurance policies that you send either a check or postal money order. Where amounts are very small, stamps will be acceptable.

Fatal Long Island Accident Brings Check

Two cars came together on a Long Island highway between Cutchogue and Mattituck. The result was this terrible accident in which Mr. Simcik, of Cutchogue, was killed. The family received \$1,000.00. This is one of the many examples of how the unexpected happens and how helpful the Insurance Company can be to the family where there is a policy.

(Right) TESTS AGRICO WITH OTHER FERTILIZER: This corn was grown with AGRICO at the Crawford County Home, Saegertown, Crawford Co., Pa. Read Supt. Karl Willard's letter below. It tells how AGRICO gave him 4½ tons more ensilage per acre than another brand of fertilizer.

(Below) 50 BUSHELS EXTRA: Mr. Irving Latham, Orient Point, Suffolk Co., N. Y., who writes: "On a test plot of potatoes, I dug 483.3 bu. to the acre where 'AA QUALITY' Fertilizer was used, and 433.3 bu. to the acre where another make of the same analysis was used. All other conditions were the same." (Oct. 2, 1930).

"We Got 4½ Extra Tons of Ensilage Per Acre"

(Right) 125 BU. PER ACRE ABOVE AVERAGE: Mr. Lawrence W. Dolph, Bliss, Wyoming Co., N. Y., in his field of potatoes grown with AGRICO last season. While other farmers in the district were averaging 175 bu. to the acre, he dug 300!

(Left) BEATS DROUGHT: Mr. Walter Ostroski, of New Brunswick, Middlesex Co., N. J., who tried AGRICO for the first time last season and, in spite of the drought, had yields as good as he ever had in the most favorable seasons. His tomatoes also exceeded the average yield per acre for his neighborhood by 25 per cent.

IN a fertilizer test last season, Mr. Karl Willard, Farm Supt. of the Crawford County Home, Saegertown, Crawford Co., Pa., found that AGRICO for Corn gave him 4½ tons to the acre more silage than another brand of fertilizer. He tells of this test in the following letter:

"Where I used your AGRICO for Corn, 3-10-6, our ensilage corn yielded 16¼ tons per acre. Another brand analysis 2-8-10, produced only 11¼ tons; so AGRICO produced 4½ tons more per acre.

"Where I used AGRICO the corn came up with a healthy color and continued to grow that way until cut, with no showing of dry leaves or stalks; while the part of the field where I used the other brand of fertilizer showed the effects of the drought and was nearly all yellow by harvest.

"I used AGRICO for Grain on my oats and got 76 bu. per acre; the other brand produced only 60 bu. per acre. On potatoes, AGRICO for Potatoes yielded 225 bu. per acre, against 150 bu. per acre on the other goods. I shall continue to use AGRICO in order to get bigger crops at lower cost."—Karl Willard, Farm Supt. Crawford County Home. (Oct. 23, 1930).

Bigger Yields—Lower Costs

Increased yields due to superior crop-producing power of AGRICO and the other "AA QUALITY" Fertilizers conclusively prove this important fact: *The better the fertilizer, the less it costs you in the long run.*

There are more than fifty different plant-food sources from which the nitrogen, phosphorus and potash used in fertilizers may be derived. These materials can be selected "on price" to make a so-called "cheap" fertilizer. They can be combined solely to meet a given chemical analysis. *But the farmer cannot obtain maximum crop-producing power that way.*

AGRICO is made from carefully-selected plant-food materials—materials selected on the basis of how good, not how cheap. In addition, AGRICO contains *extra* plant-food elements which farmers themselves have found, in tests on their own farms, play a vital part in producing more vigorous plant growth and more profitable yields.

Use AGRICO this season; there is a brand for each crop. Keep a careful record of your costs and know (don't guess) how much AGRICO increases your profit. We provide a new Crop-Cost Blank free, through our dealers. Order your AGRICO now, for prompt delivery when you need it.

What's Doing This Year at Albany

A Summary of Bills That Vitally Affect Your Business

EVERY farmer is, of course, intensely interested in any of the bills which may be passed by the Legislature of his state which affect his business. I have just returned from Albany where I went for the purpose of checking up for the readers of AMERICAN AGRICULTURIST all of the agricultural and other bills affecting rural affairs, and there is set forth in the following paragraphs a brief summary and description of these proposed bills. At the close of the session the last of this month or early in April, we will give you a final summary in AMERICAN AGRICULTURIST of all the farm bills passed.

Most of the bills under consideration this year are of not such great importance as the very fine farm laws that have been passed during the last two years. This is a rather quiet year in the Legislature, comparatively speaking. There are, however, three or four proposals of great importance.

Many farm bills are introduced in the New York State Senate by Senator Leigh G. Kirkland, chairman of the Senate Committee on Agriculture, and in the Assembly by Assemblyman Frank M. Smith, chairman of the Assembly Committee on Agriculture. A bill in either the Senate or the Assembly usually has a companion bill introduced about the same time in the other house.

Here are some farm bills now under consideration:

The Sale of Farm Produce

—MR. KIRKLAND, Senate, 268

The passage of this bill is extremely important to farmers as it increases the protection which farmers have when dealing with commission merchants. The present law is widened to define what a commission merchant is so as to include any person, whether he goes under the name of com-

By E. R. EASTMAN

mission merchant, dealer, or broker, who handles farm products. Commission merchants are now required to take out a bond for \$3,000. Under the proposed bill this is increased to not less than \$5,000, nor more than \$25,000.

Every farmer who ever has any occasion to sell produce in this way should support this bill. It is, of course, strongly opposed by commission men. You can help yourself by writing, or better still, wiring your approval immediately to Senator Kirkland or Assemblyman Smith.

Grading of Farm Products

—MR. KIRKLAND, Senate 845

This gives the Commissioner of the Department of Agriculture and Markets the power to establish grades on all farm products. It is optional as it would not compel anyone to grade if he did not wish, but if he accepts the grades and marks them according to established rules, then he would be obliged to live up to his grade.

The bill also makes it a misdemeanor to put the best products on top or on the face of a barrel or package.

This bill should certainly be approved, for it would operate to improve the quality of New York's products put on the market and to hold back cull and low quality products. Here is another chance to help yourself by expressing your approval of this measure to Senator Kirkland or Assemblyman Smith.

Bills to Eradicate TB

In the regular budget for this year which is already passed, there is an item of two and one-half million dollars to be used by the Department of Agriculture and Markets to pay indemnities for animals condemned for TB. In 1930, there were so many calls on the Department for eradication work that at the close of the year there was a shortage of five hundred thousand dollars to pay indemnities. To make this up and to be sure that there is enough to operate with in 1931, an additional appropriation bill for TB indemnities has been introduced asking for a million dollars in addition to the two and one-half million already passed in the budget, making a total for TB work in 1931 of three and one-half million dollars.

This additional million dollar bill is 846 in the Senate. It should be passed. New York is most liberal in the payment of indemnities for condemned animals and the sooner the eradication work can be completed, the better.

This additional million dollar bill is 846 in the Senate. It should be passed. New York is most liberal in the payment of indemnities for condemned animals and the sooner the eradication work can be completed, the better.

Three-Quarter Year Auto and Truck License Bill

There are two or three different proposals in the Legislature trying to establish the principle of a short (Continued on Page 8)

Clearing the New York State Capitol at Albany of Red demonstrators. Two hundred Reds created a disgraceful riot in the halls of the Legislature on March 3. They claimed to be hunger marchers, but it is said that some of their leaders had money enough to ride in taxicabs while they were in the city.

A farmer breaking hard ground with a tractor-hauled plow finds that Socony Special Gasoline plus Ethyl does the job efficiently, economically.

Tough March Plowing made easy with SOCONY SPECIAL + ETHYL

HITCH your plow to a Socony-powered tractor and make your March plowing easy. Breaking ground in the early spring calls for power . . . the kind of power Socony Special Gasoline *plus* Ethyl alone gives.

Many New York and New England farmers are finding that Socony Special Gasoline *plus* Ethyl saves them money, makes their equipment perform better at all times . . . especially when there's hard work to do.

Farmers are also finding that Socony makes a lot of products to help them on the farm. For instance:

Socony Turex Oil is made to lubricate Diesel and other internal combustion engines, and for special lubrication of all machinery where a truly high-grade,

long-life lubricating oil is essential.

Mica Axle Grease, made for axle lubrication on wagons and farm machinery, is of the best grease stock and ground mica. It fills up the pores and crevices of the axle and forms a hard, bright, smooth coating which reduces friction.

Socony Kerosene is a high-quality burning fuel. It is made especially for lamps, oil stoves and farm lanterns. Moreover, farmers find it pays to put these Socony products to work for them!

The new Socony Motor Oil . . . Herd Oil (Cattle Spray) . . . Socony Disinfectant . . . Socony Banner Gasoline . . . Leather Dressing . . . Parowax . . . Socony Lubricote (Household) Oil . . . Tree Spray Oils.

SOCONY

Petroleum Products for the Farm

STANDARD OIL COMPANY OF NEW YORK

Developing Confidence In Milk

Producers Adopt Standards That Guarantee A Quality Product

FOR many years, Washington apples, Idaho potatoes, Minnesota butter and Cape Cod cranberries have become accepted as standards or measuring sticks by which similar products are judged. Now we find that New Jersey milk is about to join the same classification as these other farm products, with recognized standards of quality. The placing of milk in such a position represents a new departure in the system of marketing this product. In the past, most milk has been sold under the well known labels of Grade A or Grade B. It has been found that both of these grades have often come from the same can and the only difference by which the consumer could judge one grade from the other would be the letter on the cap and the price she paid for each particular brand or trade name.

In recent years the New Jersey dairyman has felt the pressure of outside competition. He has found milk produced on cheaper lands, under less stringent sanitary conditions and, with lower priced labor being brought into the State and sold as New Jersey milk. He has also found that this cheaper foreign milk dumped on his local market has been the weight that has driven his prices to lower and lower levels.

Realizing that through all of these changing conditions and with the rapid development of city after city in New Jersey with their teeming populations demanding good milk, the market was rapidly slipping away, the New Jersey producer began to consider this milk question and to see if there was not something that could be done to protect the local market.

Milk Conference Called

The dairymen, of course, realized that they never could produce all of the milk required by

By AMOS KIRBY,
N. J. Editor, *American Agriculturist*

its 4,000,000 population. They also realized that among these great masses of consumers were thousands and thousands of customers who would pay a premium price if they could secure a standardized grade of milk, which they knew would be fresh, but who objected to paying existing prices for the usual grades of milk that were being sold.

In an effort to meet this situation and to see if it would not be possible to develop a specialized market for New Jersey milk among New Jersey folks, a conference of dairymen, milk experts, distributors and consumers were called together to discuss this problem. That was four years ago and out of that first meeting came what was known as the Milk Conference Board. From its humble start all groups, including the State Board of Health, joined together and helped draft a milk code that would enable New Jersey milk to be sold as such. All plans were completed and ready to be adopted, when the milk distributors refused to accept a plan that made it necessary for them to distinguish between milk produced in New Jersey and milk produced in the middle west.

State Dairy Committee Formed

Realizing that it would be impossible to agree, even after two years of hard work had been expended on the proposition, the Milk Conference Board was dissolved and the State Dairy Committee was formed. On this committee was one representative from each County Board of Agriculture, one member from each of the breed associations, and one member from the Grange, the

Farm Bureau, the Extension Service, the College and the Department of Agriculture. This group then took up the work where the Milk Conference Board had left off. With its new line-up, without the distributors, it approached the milk problem from an entirely different angle, but keeping in mind all of the time the need for standard grades for milk.

Rolling up their sleeves, the Dairy Committee went to work and within a year had a fairly well defined code of regulations worked out. It called in the representatives from the Health Officer's Association and secured their cooperation and support for the adoption of grades for milk. Following the approval of all groups concerned, the milk code was offered to the State Board of Health to be included in the Sanitary Code of New Jersey, which would have made it effective the same as if by law.

The State Board of Health called a public hearing to give all sides an opportunity to be heard. At this meeting which was held in May, 1930, the Health Officer's Association turned against the dairymen and protested against the adoption of the code on the ground that it interfered with the Home Rule Acts of the various municipalities. After months of silence, the State Board of Health calmly announced that in view of the opposition, the new milk grades could not be included in the Sanitary Code.

Second Defeat

This represented the second defeat of the dairy interests in their effort to set up definite grades of milk. Realizing that they could secure no cooperation from either the dealers or the health officials, the Dairy Committee decided to

(Continued on Page 10)

Red Clover Can Be Grown Successfully

Hardy Seed That Will Stand Cold Winters Is the First Requirement

THE other day I was listening to the National Farm and Home Hour when a few special remarks caught my attention. A report was read on the supply of things needed by farmers for spring use. Among them was the supply of 1930 American grown red clover seed. The severe drought of last summer greatly reduced the yield so that the quantity available for spring use is about 42% short. This means we must be on our guard for seed not adapted to our use here in the North.

The other day I glanced through our Farm Bureau News and an article caught my eye which stated that a carload of Oregon red clover seed was headed for the East, probably New York State. Now it is true that Oregon seed is American grown and will not be stained, nevertheless it is not adapted to our use. Warm ocean currents influence the clover seed growing section in Oregon to such an extent that their seed is only about 65% winter hardy for our use here in the East.

Quite extensive tests over a period of several years carried on by the New York State College of Agriculture show red clover seed best adapted to our use here in the Northeast is that which is either local grown or coming from some of the Canadian Border States.

I have been following very carefully trials of red clover seed from various sections of the United States for the past few years. The accompanying photo shows a strip next to the hedge of second cutting red clover in 1930, grown from seed from one of the Canadian Border States. The rest of the field was seeded to common red clover supposed to be American grown. It happened in this

way: In 1929 my neighbor and myself were drilling near each other. He called over to me and asked to borrow a little clover seed to finish his piece as he had run out. I willingly let him have a little, not thinking I was staging a field test on red clover. The first cutting from this field was not made until July 25th after which date it was quite dry here.

It is not enough that red clover seed be American grown. Large quantities come from the cornbelt where soil and climate are quite different from ours. Such seed does not do as well as that grown farther north as quite a bit of it produces plants which do not winter with us. Those who are following this line of work all agree that red clover seed should be locally

grown or come from some section as near like our own as possible.

Last summer one of the county agents from Wisconsin, accompanied by two of his good farmers, made me a short visit. During their stay we looked at my red clover seeding and, of course, the conversation turned to clover. I told what I had found true of clover seed for the East. They said the same things had been found true with them. Their chief difficulty had been to get enough seed of Northern origin to meet the demand. To overcome this difficulty they are now growing their own. So far no more troubles have been encountered than in the regular seed sections. By using either their own seed or other which is really northern grown, winter killing has been reduced to a minimum.

Red clover seems to be a plant which will adapt itself to certain conditions if seeded under those conditions a few years. Nature works her survival of the fittest plan. The weak plants die out and do not seed so only the more hardy ones are reproduced.

I am very sure it will pay every farmer to know exactly where his red clover seed was grown. It may cost a little more per bushel but when one stops to consider that usually a smaller amount of hardy seed gives better results, the dollar value in the better seed is greatest. If you have only so much money to spend for red clover I say by all means buy seed of known origin.

For those living in New York State our State College will be more than pleased to give assistance. Reliable seedsmen now furnish seed in Government sealed bags.—E. N. REED, Cortland, N.Y.

Two piles of clover cut from equal areas. The pile at the left was grown from hardy, northern grown seed, the pile at the right from seed unsuited to New York's climate.

Dean Cook of Denmark

LAST Sunday morning in his dignified old stone house set among the acres that he tilled, Herbert E. Cook passed beyond the ministries or questioning of men.

Born seventy-two years ago on the farm where he died, he was by heredity and training a farmer. Son of the soil he was born, and in the fellowship of that profession he died but the activities of a wonderfully busy and crowded life carried him into many allied fields.

My intimate acquaintance with him began more than thirty-five years ago when I made my first Farm Institute trip in his care and when he, an older and practiced worker, gave to a raw apprentice much kindly counsel and sound advice.

During the rich years of his early prime he was engaged in operating a large dairy herd and managing cheese factories, while at the same time insistent calls which came for his services took him into the agricultural service of many states.

In the old type Farmers' Institutes which for a score of years represented almost the only popular educational effort along agricultural lines, no man had a more important part than he.

Later on, when the newly established School of Agriculture at Canton was having a hard time to establish itself in public confidence, the trustees turned to this Lewis County farmer, this man without a college degree, for its executive head and for ten years he was Dean of that Institution. The title clung to him and to this day among his neighbors and townfolk, he is not "Herb" or "Cook" but "The Dean" and this in the face of the cynical proverb that a prophet is not without honor save in his own village and among his own kin.

Then he came back to the farm and resumed his work there as a pushing, aggressive man of affairs, seeing visions, dreaming dreams, and planning great things for the coming days.

The close of his life—the last three years—was darkened by ill health and eventually hopeless invalidism. He saw the shadow and felt it, but he was neither embittered nor afraid.

Many good things might be said concerning him. He was a singularly wise farmer, a loyal friend, a devout churchman, an unselfish, lovable gentleman and a man whom to know was a very great privilege. Out of his rich fund of farm experience he wrote his "Plow Handle Talks"

which regularly appeared in the American Agriculturist during many years and which were almost the essence of agricultural wisdom.

It is only truth to declare that for a score of years until ill health restricted his activities—perhaps even until the day he died—he was Northern New York's most distinguished farmer.

But now he is gone out from among us and in thousands of New York farm homes they will recall him and his genial speech and his whimsical philosophy and they will speak of him with tenderness.—JARED VAN WAGENEN—(Broadcast WGY, February 27, 1931.)

Oleo Bill Passed Congress

WE have had no better example of what organization can do than in the passage of the Brigham-Townsend Oleo Bill, passed by Congress just before it adjourned. The whole dairy industry worked as a unit to get this bill through. It limits the color that may be used in oleo so that it cannot imitate butter. The bill came up as a result of a ruling of the Federal Government which allowed oleo to masquerade as butter. It is estimated that the Brigham-Townsend Bill will save dairymen a million dollars a day and failure to secure its enactment would have come close to ruining the dairy industry.

Naturally, then, congratulations are in order to the farmers for the splendid fight made by the farm organizations and to those milk dealers and others who cooperated.

A Proposal to Improve Rural Health Service

SOME time ago Governor Roosevelt appointed a special health commission, with President Farrand of Cornell as chairman, to study health conditions in New York State and to recommend legislation which would improve the situation. On recommendation of this Commission Senator Wicks, chairman of the Committee of Public Health, has introduced into the present session of the legislature a bill which makes the county the unit of local health administration. The Health Commission also recommended to establish in two or three additional sections, county tubercular hospitals similar to the one already established at Raybrook, New York, and the bill provides a small appropriation for the purpose of securing a site for these hospitals.

This bill is possibly the most important piece of health legislation that has ever been introduced in the State. It is of special importance to rural people because they will be the chief beneficiaries of the new county health departments. Four counties in the State already have such departments: Cattaraugus, Suffolk, Westchester, and Cortland, with a County Board of Health and Commissioners of Health in each. All are operating satisfactorily.

Best of all, if Senator Wicks' bill passes, these county boards of health can be established without additional local expense. The State will contribute to any county one-half of the annual cost of operating the health departments. Funds which are now used for health purposes in the towns and counties will be all that will be necessary more than to make up the county's half of the expense.

The Wicks bill, if passed, will simplify the present complicated and inefficient local health organizations. For example, excluding county and city health units, there are a total of 1036 local health units, with a population range from a few hundred to a few thousand persons. In towns the town board, and in villages the trustees, constitute the boards of health. These boards appoint a physician as local health officer with an annual salary of not less than 15c per capita, amounting to from \$150 to \$200 per year. This system was all right in 1850, but it fails to give country people any adequate protection today. The units are too small. By the Wicks bill, one

real board will be substituted for the many town and village boards of health, the County Milk Inspection Committee, County Clinic Committee, and Board of Managers of County Laboratories. All of these would be consolidated. Duplications and over-lapping which now exist will be prevented and better health protection can be furnished for present expenditures. Facilities for maternity and infant hygiene can be organized and efficiently conducted. These are practically impossible now under the present system, particularly for country mothers.

The decreasing number of country doctors is bringing home to country people every year, particularly in the winter time, the absolute necessity for better health protection and service, and organized county health units will go a long way toward furnishing this protection. The bill is a long step in the right direction and should be passed.

Ask Your Supervisor to Explain This

ASSEMBLYMEN of New York State and town supervisors will find it difficult to explain to their friends and neighbors back home why the Rice bill was defeated by the Assembly on March 4. This bill would have saved school tax payers in the towns approximately \$137,277 which now goes to the supervisors for little or no service.

Under the present law, state aid funds are first paid by the State to the county treasurer, who in turn, pays them to the supervisors of each town, who distribute them to the school districts. For that he collects a fee of one percent.

Under the old district system, before there were many union free school districts or central school districts, the supervisor rendered a service because he was practically the treasurer for each of the small districts in his town. He approved the vouchers rendered by the trustees of the districts and paid the money direct from these vouchers. The supervisors still render a service for the one-room districts, who in most cases, have no treasurer, but it is plain that they perform little or no service for either the union free schools or central school districts.

The Rice Bill provided that school funds from the State for central and union free school districts should be paid by the State Comptroller direct to the county treasurer of each county, who in turn should pay these funds direct to the treasurers of the union free schools and the central school districts. Here are a few examples of what this present scheme is costing taxpayers:

The supervisor in one town in Allegany County, collects \$181 for the moneys which he handles for just one union free school district; the taxpayers of a district in Albany County pay the supervisor \$167; a union free school district in Oneida County pays its town supervisor \$404; a central school district in Schoharie County pays its supervisor \$474; and another one in Madison County gives the supervisor \$623. These charges are paid directly from local taxes.

We do not believe that the great body of supervisors would stand for this sort of thing—at least they would not fight to prevent its correction. But there are a lot of supervisors who fought hard and brought pressure to bear upon the Legislature to prevent the passage of the Rice Bill.

Eastman's Chestnut

EVERY farm woman who has contended with the men folks to keep them from tracking in mud on her best rugs will appreciate the following:

"Hello, Jake," said the farm hand. "Why ain't you comin' to the weekly dances down at the grange hall?"

"Ho, ho, dances!" said Jake. "I could never learn to dance."

"You could, too. It's dead easy," replied the farm hand. "All you got to do is to keep turnin' around and wipin' yer feet."

With Our A.A. Boys and Girls

EIGHT chapters of the Association of Young Farmers of New York participated in a radio broadcasting contest as a feature of the mid-winter meeting and leadership training school of the Association held in connection with the annual Farm and Home week at the State College of Agriculture during the period February 9-15. The delegates from the Trumansburg chapter were adjudged the winners in the contest, which included delegates also from Naples, Bath, Albion, Horseheads, Wolcott, Madison and Homer. Each group presented a 20-minute program including business activities, yearly chapter program, educational features and considerable humor of special interest to farm folk.

The boys went on the air in the early afternoon over station WEAL, the official station of Cornell University.

boys are making in proficiency in the various classes. Several teams made perfect scores. Following is a summary of the judging awards by teams and by high individual boys in each class.

Dairy Cattle 1st place, Owego represented by George Ashpaugh and Donald Foster, second place, Skaneateles represented by Frank Harvey and Frank Collier. Third place, Marcellus represented by Francis Ebert and Roy Murphy. Roy Murphy of Marcellus was high individual.

Poultry judging first place, Trumansburg represented by Alton Worden, second place, Churchville represented by James Ehrementrout. Third place, Massena represented by Robert Parsons.

Potato judging first place, Cobleskill represented by Lawrence Gibson and Frank Prior. Second place, Wolcott, represented by Wyman Loveless and Ralph Cook, third place, Sodus represented by Wilford Cottrell and Cornelius Leenhouts.

Fruit judging first place, Highland, represented by Winfred Conklin and Donald Weaven. Second place, Geneva represented by Kenneth Burger and Ward Robbins. Third place, Sodus represented by Henry VanAcker and George Bodine.

Milk judging first place, Forestville represented by Astor Crowell. Second place, Chautauqua represented by John Gleason. Third place, Constableville represented by Chester Freeman.

Plant Disease judging first place, Morrisville represented by Eugene Steg and Ned Fuller.

Second place, Wolcott, represented by Arthur Kasten and Charles Hall.

More than 700 young farmers were present in attendance at the mid-winter business meeting and the banquet in Memorial Hall. The special American Agriculturist Achievement Award conducted as an added feature of the Master Farmer program proved to be one of the most stimulating encouragements for the young farmers, that has yet been proposed.

Puzzling Problems

By R. H. KASPER

1. A man is 40 years old. His son is 20 years old. How old will the father be when the son is $\frac{3}{4}$ of the father's age?

2. Jones, Smith and Brown can walk around an island in 3, 4 and 5 days respectively. Starting together and walking in the same direction, how many trips will each have to make before they will all meet at the starting point?

3. Given a 7-pint vessel and an 11-pint vessel, how would you measure exactly 6 pints?

4. John hits a target at the rate of 7 out of 12 shots. Joe hits the target

3 times out of 4. After the target has been hit 32 times, how many shots did each fire?

5. A charity donation amounted to \$48. Each time Jones donated \$1, Smith donated \$2, and Brown \$3. How much did each donate?

6. After $\frac{3}{4}$ of a basket of apples had been sold, $\frac{1}{5}$ of the remainder decayed, and the balance was divided among 7 boys, each receiving 6 apples. How many apples were in the basket?

(Turn to page 21 for answers)

A Singing Contest for 4-H Clubs

BOYS' and girls' clubs will have the opportunity to show what good singers they are. They can first do this in their own county singing contests and later they can compete with other clubs from different parts of the state, at junior field days at Cornell sometime late in June. The Department of Rural Social Organization of the New York State College of Agriculture is taking the responsibility of organizing the contests, and they have made some rules to be followed by the clubs wishing to enter. Here are the rules:

"Each club will learn to sing 'Dreaming' and 'A Plowing Song' and one other song from the list you will find below. Learn to sing them well. Sometime during the spring a contest will be arranged to determine the best club in your county. At that contest each club will sing three songs, the two required selections and one song which the club itself has chosen from the optional list. The club that wins shall represent the county in the next step of the contest, competing with the winners in other county contests. The final contest will be at Cornell during Junior Field Days and a prize will be awarded that club from the entire state which sings the best. Every club that enters the contest will have the fun of singing and will have learned some new songs by the end of the year.

List of Songs

Away for Rio, Sourwood Mountain, Billy Boy, Begone Dull Care, Blow the Man Down, Sweet Kitty Clover, Bendemeer's Stream, Frog Went a-Court-ing, Spanish Guitar, Kye Song of St. Bride, Music in the Air.

Try These On Each Other

(Answer any ten)

1. What city has the largest population in the world? In the United States?

2. What is the capital city of France? Of the British Empire? Of the United States? Of Germany?

3. Which is the longest river system in the world?

4. What is the largest state in the United States? the smallest?

5. Name five chief manufacturing cities in the United States?

6. How would you go by water from New York City to Duluth, Minn? From New York to Seattle, Washington?

7. Where are the great centers for manufacturing farm machinery?

8. Where is most of our wheat for bread flour grown?

9. What states produce most of our gasoline?

10. What countries specialize in raising beef cattle? Cotton? Dairy

Another Pony

I am sending a picture of my pony, "Peanie." Maybe little boys and girls who read the American Agriculturist would like to see her. She is very kind and gentle.—Bub. Gahler, Holmdel, New Jersey.

products? Bananas and citrus fruits?

11. From what country do elephants come which can be taught to do useful work and circus tricks?

Will Your Name Be on the Honor Roll?

SOME schools start the year with every student on the health honor roll, then as first one and then another has a cold, his name is stricken off. The cold is the commonest thing there is in the world in wintertime and when we know how much is lost in efficiency and happiness because of colds, every possible measure should be taken to check them.

It takes real cleverness to avoid catching colds, yet the rules are simple; wash hands before touching food and keep hands away from mouth; simple food with plenty of vegetables, fruits and milk; regular hours and plenty of sleep; 8 glasses of water daily; careful ventilation which avoids stuffiness or extremes of temperature; clothing warm enough to prevent chilling and yet allow free circulation of air through its meshes; avoid getting wet (if this does happen change quickly to prevent chilling). These simple health rules would do much to keep everybody's name on the honor roll. But if one is unfortunate and catches cold, he will be very kind and considerate of others if he covers his coughs and sneezes and keeps his hands away from objects that other people must touch.

The Letter Box

Could you please print my letter in the American Agriculturist? I am very anxious to have boys and girls write to me. I have one correspondent in France and I would like to hear from boys and girls in the United States. I will answer all letters I receive and please send a snapshot. I am sixteen years old and like all outdoor sports and moving pictures.

Louise Tears RD No. 2,
Rushville, N. Y.

* * *

THE regular meeting of the Live Wire 4-H Club was held at the schoolhouse on February 6, 1931 at 7:30 p. m. All members were present except one. County Farm Agent Harold L. Hoyt was present and gave a written test on poultry. Mary Mucha got the highest mark and the others did well with it. Edward C. Wells gave a talk on "Thrifty." Tessy Salak and Mary Mucha were appointed committees for the April meeting.

sity. The boys from Trumansburg featured their regular business meeting and the transaction of the necessary negotiations in purchasing carlots of fertilizers and improved seed potatoes for members. The prize was a "little general" radio set contributed by the local dealer of the General Motors Corporation.

The young farmers from the Naples Chapter won second place with their fine presentation of the reforestation project of their local association. The third place was awarded to the young men from Bath High School, who gave a thoroughly practical presentation on the growing of improved seed corn co-operatively. Other presentations included the cooperative relationships between the local chapter and the county fair, plans for and activities of fathers' and sons' banquets, athletic contests, cow testing associations, competitive egg laying contests and pure bred sires.

The judging contests in live stock, poultry, potatoes, fruit, milk and plant diseases proved to be unusually stimulating to the young farmers. The conductors of the contests were greatly impressed at the progress which the

A group of "young farmers" in attendance at the leadership training school during farm and home week at Cornell University.

BIG YIELDS

PRODUCTION COSTS are lowered by increasing yields without increasing labor costs or acreage. Yields per acre can be increased by applying Armour Fertilizers. That means *you* can reduce your growing cost per bushel or pound and increase your returns on each acre by using Armour Fertilizers.

There's an Armour Fertilizer to supply the plant food needs of any crop—corn, potatoes, tobacco, fruit, truck, canning. There's an Armour Fertilizer suited to the crops on *your* farm—a fertilizer that will increase your yields per acre and help you make a profit this season.

Your Armour dealer can supply the fertilizer you need this spring. See him the next time you are in town.

With the A. A. Fruit Grower

High Spots in Spraying Fruit

IN order to secure a good job of spraying, it is essential that the fruit grower have proper equipment. A sprayer should be capable of giving a fine mist spray at a pressure of 250 lbs. or better and be large enough to cover the orchard in from 2 to 3 days. If a duster is used, it should be large enough to carry the dust to the tops of the trees. Keep your sprayer in good repair so that there will be no delays from breakdowns.

The New York State fruit grower will find it to his advantage to use good materials regardless of cost. Buying the old standard spray materials from a reliable dealer is still the best practice. A good sprayer and the best of materials will not be of any use unless care is taken in applying the spray. The top portion is especially important since scab spores work down to all parts of the tree if one spot is missed. Severe burning may result if the spray gun is open wide for the lower branches. Soak all parts of the tree with a fine mist for best results. Follow your spray chart as to the proper time for spray protection. Spraying at the proper time will give you a fine chance for a clean crop.

of their maturity, we have Early McIntosh, Milton, McIntosh, Cortland, Macoun and Northern Spy. Be sure if Northern Spy is planted, that you have some Macoun, also, to provide proper cross pollination.

Do Not Crowd the Trees

ACCORDING to Professor G. F. Warren, "one of the greatest enemies to the apple orchard is the apple tree." Recent experiments at the New York State College of Agriculture has certainly proved this statement.

Orchards, planted thirty feet apart, yielded on the average, 43 bushels to the acre less than orchards planted forty feet apart. This increase in yield was obtained with nineteen less trees to prune and spray. Forty or forty-five feet between trees seem to be the economical distance for the planting of the average orchard.

Ringling May Cause Blight

We had serious trouble last year with blight on our apple trees. Ringing of the trees was done by scoring twice with a knife blade without removing the included bark. Did this cause the blight and what is the remedy?

Delayed Dormant Spray Important

THE delayed dormant spray, which is the first shot to be fired in the annual battle against insects affecting apple trees will soon be due. This spray is applied just as the buds begin to swell and show green at the tips and is directed against the scale, blister mites, aphids and early caterpillars and against apple scab.

The common spray solution for the delayed dormant spray is lime sulphur at the rate of one part of the concentrated mixture to eight parts of water; to each 100 gallons of this mixture is added 3/4 of a pint of nicotine sulphate and from two to three pounds of powder lead arsenate or from 4 to 6 pounds of paste lead arsenate. As with all sprays, the results from this delayed dormant spray will depend largely on the manner in which it is applied. As a general rule, it is advised that spraying from the ground rather than from the top of the spray tank will give best results. With large trees better results will be secured by having two men, one spraying from the ground, the other from the tank.

ACCORDING to the experiments at Michigan State College, the ringing of Baldwin apple trees in the manner you describe caused serious blight infection. Northern Spies treated in the same manner did not seem to develop the trouble. It is suggested that knife blades used in ringing should be dipped after each cut in a mercury-glycerine disinfectant.

One Method of Cross Pollination

We have heard of taking blossoms from another variety and placing them in a blossoming orchard in pails of water in order to secure cross pollination. Does this method work or is it just merely an idea that someone has tried out?

ALTHOUGH this method is merely a makeshift, it does get good results in some cases. There is no question but that cross pollination is necessary in order to get the best crop on a good many varieties. Years ago we had too many varieties. Orchards would have perhaps fifteen or twenty different kinds of apples and of course there was no trouble about cross pollination. Then we came to the conclusion that we should grow three or four varieties only and in many cases entire blocks of apples were set out without any mixture of varieties at all. Then when the crop was poor, Experiment stations discovered that it was from a lack of cross pollination. By all means, try the plan of putting blossoms from other varieties in among your trees in pails of water until you can top work some of the trees into other varieties.

Apple Varieties for the Home Orchard

Would you tell me good selections of trees for a garden orchard suited to our central New York conditions?

APPLES of the McIntosh varieties will probably give you the best results. To provide fruit throughout the season, we would suggest one or several varieties of this strain. In order

Strawberry Management

A PERSON who has never grown strawberries cannot realize fully the vast increase in next year's crop which will result from keeping the newly set plantation free from weeds.

Next year's crop depends almost entirely on the first year's growth. Weeds rob the plants of food and moisture. A vigorous growth results in an abundance of food which is stored in the root system, much of which will be used the next year to mature the crop.

At the same time, the crop during its first season requires plenty of moisture, which usually means an abundant supply of organic matter in the soil to hold moisture, and also needs plant food which is usually supplied before the plants are set out. Either farm manure or commercial fertilizer, or both, should be used.

Growing Raspberries

ONE of the essentials in growing raspberries is to manage the plantation in a way that will provide an adequate moisture supply during the growing season. One of the first essentials is to have a soil which is well supplied with organic matter which will retain plenty of water.

The usual management of the plantation is to cultivate early. This is especially important because any weeds or cover crops which are allowed to grow in the spring will remove moisture that the raspberries need later. The plantation is then cultivated until July, and either weeds allowed to grow thereafter or a cover crop planted.

Second Crop from Strawberries

Is it usually profitable to grow two crops of strawberries from the same plant?

WHERE this practice is commonly followed, the second year's crop will not be as high in quality but of course the cost of growing is much less. The usual management is to mow the field after the berries are harvested, then to plow between the rows and sometimes make an application of commercial fertilizer, this fertilizer to be applied between the rows and worked in to avoid possible injury to the plant.

The Viking Raspberry

THE Viking raspberry is the result of the cross between the Cuthbert and the Marlboro varieties. Because of its hybrid origin, Viking has extreme vigor. The canes grow straight and strong to a height of 7 or 8 ft. They are nearly thornless and hold up their heavy load of fruit without protruding in the row or tangling in the foliage of the new canes. This variety is a large bright fruit. One of the most important distinctions of this variety of interest to New York State growers is its resistance to disease and tendency to take mosaic only in a mild form.

New Grape Bulletin

SUBSCRIBERS who raise grapes will be interested in a ten-page bulletin recently published by the New York State Experiment Station at Geneva. The title of the bulletin is "Grape Culture in New York", and it is written by F. E. Gladwin, who for many years has had charge of the Vineyard Laboratory at Fredonia. You can get your copy of this bulletin by writing to the New York Agricultural Experiment Station at Geneva, or we will be glad to forward your request.

One pound of this new seed potato dip treats 80 bushels

20% INCREASE WITH IMPROVED SEMESAN BEL!
Above: Yield from a fraction of an acre.

Say good-bye to old "soak" treatments!

Stop wasting two hours on a one-minute job! Save time and money by treating your seed potatoes the new, modern way—with New Improved Semesan Bel.

So effective that one pound now treats 70 to 80 bushels—four times as much seed as you could treat with Semesan Bel last year! Yet so economical that it protects your seed for as little as 1½¢ per bushel—even less than the cost of corrosive sublimate treatment!

Just Dip and Plant

Improved Semesan Bel treatment is quick and easy. All you do is dip your seed and plant. But the advantages of this simple method are tremendous! Rhizoctonia and scab organisms are killed on the seed. Your stand is stronger, healthier. You get a cleaner, larger yield per acre. Without seed injury—without extra labor—at very little expense!

Treat Certified Seed, Too

All seed needs Improved Semesan Bel, for no seed is entirely disease-free. You can treat your seed for as little as 1½¢ a bushel, and even in very small quantities the cost does not exceed 3¢ a bushel. Ask your dealer for pamphlet, or write Bayer-Semesan Company, Inc., Department 61, 105 Hudson St., New York, N. Y.

THE ROCKFALL NURSERY CO.,
Box 9001 Rockfall, Conn.

TOP DRESSING is vital to WHEAT this year

Bags at left contain 16 bu. of wheat made on 1 acre fertilized with 250 lbs. of 2-10-3. Bags at right contain 31.7 bu. made on 1 acre with same fertilizer, PLUS 100 lbs. Chilean Nitrate, a net gain of 15.7 bu. on 1 acre due to Chilean. Farm of T. P. Conner, Millersburg, O.

THIS YEAR every foot of land must do more than ever . . . if your investment and hard work are going to show you a profit. This year you'll need extra bushels on each acre to bring costs down below present market prices.

That means liberal yield-increasing applications of Chilean Nitrate of Soda . . . the extra bushels it makes, pay back its cost with plenty to spare.

Top dress winter wheat and other small grains with Chilean. It supplies quick-acting nitrogen, just when the crops are hungry for it, and need it to get off to a good start. It strengthens the plants, pushes them ahead and greatly increases the yield. 100 to 200 lbs. per acre . . . that's all. But it makes all the difference between money-farming and—the other kind.

Chilean is Natural Nitrate

When Nature made Chilean Nitrate, hundreds of years ago, she undoubtedly had you in mind. Else why did she fashion this super-nitrate, with its Nitrogen, Iodine, Boron, Magnesium, Potassium, Calcium . . . each one a plant food in itself? Nature made Chilean Nitrate to help you make your crops—Safely! Surely! Profitably! Chilean is Nitrogen PLUS . . . that's why it is so much more effective.

New 100 lb. Bag: Lowest Price

Chilean is now packed in 100 lb. bags for greater convenience. Easier handling. Better condition of bag and contents. And the price is lowest in many years, combining economy with convenience. Chilean comes in two forms—Original Chilean (Crystals) and Champion Brand (the pellet nitrate).

The European Corn Borer Situation

A NUMBER of inquiries have come to us concerning the spread of the European corn borer. Dry weather in the summer of 1930 was unsafe for the corn borer and in some sections there was an actual decline in the amount of infestation. In spite of this, however, the corn borer has spread into some more territory and is now found as far west as Indiana and Michigan. United States Department of Agriculture figures indicated a decrease in the number of corn borers as follows: 21% in Michigan, 58% in Ohio and 29% in Pennsylvania. There were increases of 33% in Indiana and 11% in New York.

It is our understanding that all hope of exterminating the corn borer has been abandoned. Through experiments, controls have been worked out which are quite effective. They are as follows:

1. Corn should be cut as close to the ground as possible as soon as it is mature enough for the purpose grown. This will prevent large numbers of borers from moving down into the stubble and remaining on the field to start an infestation the year following.
2. As much of the corn as possible should be made into ensilage, thereby killing the borers. Sweet corn stalks after removal of the ears should be cut and fed or disposed of in such a way as to destroy the borers in the stalk. All other stalks should be so handled as to destroy the borers in them.
3. All corn stubble and unharvested stalks, should be completely plowed under to a depth of six inches or more preferably in the fall, but if in the spring not later than May 15 or June 1, depending upon the earliness of the season.
4. Weedy areas adjacent to infested corn fields should be cut and burned. Any debris left on top of the ground after plowing and fitting the land for the crop in the spring should be gathered up and burned. It is generally conceded that the earliest planting and maturing corn is most likely to be damaged by the insect. It should be remembered that the success of the application of the above practices depends upon a general compliance with the same by all of the farmers in a given area.

Effective January 22, 1931, some changes were made in quarantine areas. There are two strains of the corn borer, one that develops two broods of moths a year, called the two generation form, and the one generation form. The two generation form is more injurious and is found in most of the New England States and on Long Island. Quarantine regulations on this two generation form cover the movement of ear corn, broom-corn, sorghums, Sudan grass, cut flowers or entire plants of chrysanthemums, asters, gladioli and dahlias, also lima and shell beans, rhubarb, and beets with tops.

The one generation form extends from Vermont west to Michigan and Indiana and south to West Virginia.

Method of Applying Fertilizer

Will the best results be secured in growing cabbage by putting the fertilizer in the row or by spreading it broadcast before the plants are put out?

ALTHOUGH some growers apply all the fertilizer broadcast and work it into the soil before the plants are set out, there is some evidence to indicate that at least part of the fertilizer should be put in the row. The essential factor is to get it well worked into the soil without having it in direct contact with the roots.

Nothing else can do this job

FERTILIZER has got to grow your crop profitably—and it can't do this job with anything but plant food.

Pitch your crop on *plant food*, not on cheapness. Buy *plant food*—the best you can use, the best you can afford, in a good fertilizer mixed right. Buy V-C fertilizer and get the plant food that will grow your crop profitably.

With the A. A. VEGETABLE GROWER

Tomatoes Require Manganese

VEGETABLE growers who raise tomatoes in greenhouses have had some trouble which manifested itself in a lack of green coloring matter in certain parts of the plant. At the same time there has been a tendency for a slender growth in the tops of the plants.

The Ohio Experiment Station has found that in some cases the addition of a manganese compound seems to cure this trouble, indicating that a lack of manganese in the soil is the cause of it. Under experimental conditions they have remedied this trouble by adding manganese sulphate at the rate of 75 to 100 pounds per acre as a top dressing just before watering. Improvement in the plants is noted within five or six days.

Staking Tomatoes

Does it pay to stake and prune tomatoes?

IN general the total crop per acre is less and those who grow the crop for canning factories do not usually follow this practice. However, the market always pays heavily for early tomatoes and staking and pruning are likely to give a little earlier crop and a crop with a larger average size.

Buying Asparagus Plants

Are one or two year old plants preferred when setting out asparagus?

IT is generally agreed that there is less danger from injury where one year old roots are used. It is always a good idea, however, to cull out those that do not show a thrifty growth. There has been a feeling which may not be entirely justified, that where two year old plants are bought, buyers are likely to get the poorer plants which, because of slow growth, were not sold the previous year.

Muck Best For Celery

What soil is best for growing celery? What variety do you recommend for the home garden? D. S., New York.

THE best soil for celery is a well rotted muck soil and the next best kind of soil is a sandy loam that has a good supply of decaying vegetable matter mixed with it. Giant Pascal is a big variety. It is not grown much for the market because it is hard to blanch but is a good variety for the home garden. Columbia and European are other good varieties.

Nitrogen for Asparagus

Will an application of a quickly available nitrogen early in the spring help the asparagus crop this year?

PROBABLY not. It is generally understood that the asparagus crop is grown from the plant food stored up in the roots. In other words, fertilizer added this spring will help next year's crop by producing a heavy top growth which in turn manufactures starch and stores it in the root system.

Prolonging the Season

When planting a succession of vegetables such as sweet corn or peas for the home garden, is it advisable to make later plantings of a later variety or to make successive plantings of the same variety?

THERE is no reason why an early variety cannot be used for successive plantings and there are some advantages unless the later variety is of better quality. If an early and late variety is planted at the same time, the later variety will, of course, not become mature until some time after the early variety.

YOUR pastures should be fertilized at least six weeks before you turn out your cows, with 600 pounds of well-balanced potato fertilizer per acre.

The two photographs above were made on the farm of C. C. and C. J. Wood at Skowhegan, Me., on May 29, 1930. The unfertilized pasture at left yielded only 1,210 pounds of green grass per acre. The pasture at right, fertilized with 600 pounds of 5-8-7 per acre, yielded 7,260 pounds of green grass per acre.

This is typical of 50 tests in nine northeastern states in which the average profit was \$29.62 above the cost of the fertilizer. This profit was secured by more days of good grazing—earlier in the spring and later in dry weather.

Last season fertilized pasture produced good green feed two weeks before un-

Fertilize NOW!

*Don't Wait Until
You Need Feed*

fertilized pasture was fit to graze. The fertilized pasture also had a thick vigorous sod at the end of the season.

Don't delay fertilizing until you begin to feel the need for feed. Fertilize now and give your herd good green feed two weeks earlier this season. Use 600 pounds of well-balanced potato fertilizer per acre. Potash pays!

Let your cows cut and haul their own feed . . .

"It has been known for years . . . that nitrogen is the growth element and can be depended on, barring severe drouth, to increase the yield almost in direct proportion to the amount used," states Prof. John B. Abbott, a leading authority on pasture fertilization.

Nitrogen produces an abundance of tender, high protein grass and enables you to pasture your cows earlier—and later—in the season, thus cutting down on the amount of barn feed you must raise or buy.

At least one month before the normal grazing season begins, apply 100 to 150 pounds of Sulphate of Ammonia per acre to your pasture lands; follow this with a second application of 100 pounds of Sulphate per acre six weeks later. If your pasture has not received complete fertilizer recently, the initial application should be a complete fertilizer containing 6 to 10% nitrogen.

Arcadian Sulphate of Ammonia is an American product analyzing 20.56% nitrogen (25% ammonia). Dry and free-running, it is easy to apply by hand or machine. Ask your fertilizer dealer for it, and write The Barrett Company for further information on how to fertilize pastures for profit.

An unfertilized field which will ordinarily support four cows will, if properly fertilized, support nine or more cows.

With the A. A. DAIRYMAN

Developing Confidence in Milk

(Continued from Page 3)

take the matter into their own hands and begin the development of a milk market for their product without the cooperation of the distributors.

The first step in this program, called for the establishment of definite grades of milk, which would be produced under the most sanitary conditions, cooled to a very low temperature and delivered to the consumer within forty eight hours.

In their scheme for grades of milk, the Dairy Committee and even the Milk Conference Board took recognition of certified milk and the existing grades of both raw and pasteurized milk that was being sold in addition to New Jersey Grade A Raw and New Jersey Grade AA Pasteurized milk.

The Two Grades

It setting up these grades, the Dairy Committee, insisted that all milk sold under these specifications must meet certain standards that were in excess to those now being followed. The committee believed that these New Jersey grades produced under strictly sanitary conditions would find a market where it would be preferred to other types of milk.

Grade A Raw—In setting up the standards for this high grade product, the committee unanimously demanded that it should come from cows that had been tested for tuberculosis. It insisted that the animals be tested physically every six months and all helpers who handled the milk should also pass a health examination.

The next step was to demand that this grade of milk be cooled down to below 50 degrees immediately after being produced, it must not have a bacteria count in excess of 30,000 bacteria on delivery to the consumer and must reach the home within forty eight hours after being produced. The same strict sanitary requirements about the barns and the same chemical standards as now required by law were included.

Grade AA Pasteurized—This second grade of milk, requires about the same strict requirements from the testing of the cattle, the examination of the workers on to the delivery to the consumer within forty eight hours after being produced. Possibly the only variation between these two grades was that the pasteurized milk could contain as much as 100,000 bacteria before and 10,000 after pasteurization. Another important requirement was that both of these grades of milk must be produced on New Jersey farms.

Start Delivery

After drawing up the grades, the next step was the formation of an organization, known as New Jersey Dairymen Inc., composed of those milk producers who could meet these requirements. The second step was to bring in the independent milk distributors who were willing to handle these New Jersey grades and have them form the New Jersey Distributors Inc.

When the machinery was set up and ready to go, it was found that approximately 30,000 quarts of these New Jersey grades of milk were ready for distribution. Consumers approached to try the new milk were delighted with its high quality, its fine flavor and its freshness. Since that time, which was less than three months ago, the market has expanded and the demand is growing until today about 50,000 quarts of these special grades of milk are ready to go to the consumers.

Despite the opposition of the big distributors earlier in the deal, it has been developed that the consumers have been waiting for these high grades of

FREE "A BETTER WAY TO PUT UP HAY"

describing easier, cheaper, quicker method of putting up hay sent to any tractor owner who feeds 20 tons of hay or more per year. Write Feed Service Dept., Papec Machine Co., Shortsville, N. Y.

IF YOUR Cows Had Money to Spend—

WHAT would they buy? Shoes, candy, new hats? No! Every last one of them would trot down to the feed store for Dried Molasses Beet Pulp.

They know it's good—that it is bulky and palatable—that it is not only highly digestible itself but that it aids the digestion of the entire ration. Most important of all they know that Dried Molasses Beet Pulp increases the flow of milk.

And being of the gentler sex they know a bargain when they see it—prices are lowest in ten years.

Don't pay a fancy price for hay—six pounds of Beet Pulp will do the work of ten pounds of hay and do it better. Don't worry if your silage is getting low, Beet Pulp is even better than silage. See your feed dealer without delay. Shipments made direct from factory nearest to buyer.

UNADILLA SILOS

Are Leaders!

Many features of convenience and safety have made Unadilla Silos the leaders throughout the east.

The gambrel roof insures a silo packed full. The patented door can't stick or freeze, yet is air and water tight. The door fasteners form a wide, easy, safeladder. The continuous door opening makes it possible to shove silage out instead of lifting it over.

Attractive discounts for cash and early orders. Time payments if wanted. Write for free catalog.

Also tubs, tanks and vats

UNADILLA SILO COMPANY
Box B, Unadilla, N. Y.

(Continued from Opposite Page)

New Jersey milk, but did not know that there was such a product on the market. Today, both the producers and the distributors through their respective organizations are functioning properly and expanding. The next step is the raising of a fund of one mill per bottle for advertising purposes. The distributors have agreed to pay a royalty for the caps and the trade mark, which are owned by the dairymen through their own organization.

Prices Unchanged

Although the milk costs more to produce than ordinary milk and it is also worth more to the consumer, it is being sold at the same or prevailing prices charged by the big distributors. The meeting of prices on an equal basis, is proving a big selling point especially at this time when business is rather dull and the public has only a limited amount of money to spend for food.

It has been found that once the consumer realizes that the New Jersey grades can be bought for the same price as ordinary milk, another buyer has been secured. So far the results have been far beyond the fondest hope of the sponsors of the movement. The consumers are pleased with their product. The distributors are finding it an easy product to sell and the producers have at their hand a market that shows unlimited possibilities for the future.

New Milk Legislation

The next step in the program of the New Jersey milk producers is to have these new grades legalized. Bills have been introduced in the legislature aimed to have these standards made into a law. As a companion bill to protect the milk consumer as well as the producer, the farm group is sponsoring another measure which requires that all milk brought into New Jersey, shall be produced under the same sanitary conditions that are imposed on the local producers.

It must be kept in mind that a large portion of the milk now produced in New Jersey will always be sold as Grade B Pasteurized. In an effort to protect all parties, the farm group by advocating the second bill forces foreign producers to meet these same sanitary requirements.

Regardless of whether the bills are passed or not, the spirits of the producers are not dampened and if they lose this year, they will be back again as they are determined to protect their home market against low grade milk from outside sources.

TB Eradication Progress

E. T. FAULDER, director of the Bureau of Animal Industry of the New York State Department of Agriculture and Markets, has just completed figures comparing TB eradication work done in the fiscal year of 1930 with that done in the corresponding period in 1929. Herds tested in 1930 were 91,654 as compared with 79,944 in 1929. Cattle tested this last year were 1,130,271, a considerable increase over the 1929 figures which were 913,715. The reactors in 1930 were 54,651 as compared with 52,284 in 1929.

Bulletin on Dairy Statistics

The New York State Department of Agriculture and Markets has just issued a bulletin giving a vast amount of statistical information on the milk supply of the New York City milk shed. This is bulletin No. 241. Any reader of American Agriculturist who would like a copy of bulletin No. 241 will receive one upon addressing a request to R. L. Gillett, Agricultural Statistician, Department of Agriculture and Markets, Albany, N. Y.

We will also be glad to forward any requests sent to us to the State Department.

If the garden gets droopy in the summer, try topdressing with two pounds to 100 square feet of a complete fertilizer carrying 5 per cent of nitrogen, 10 per cent of phosphoric acid, and 5 per cent of potash.

NEW IDEA Farm Equipment

Less than \$5 per year—does Your Spreader cost you More?

A FARMER in Pennsylvania owned a NEW IDEA spreader which had seen many years of service. The Lime Spreading Attachment and other improvements on our present Model 8 appealed to him, so he offered his old machine in trade. Figuring the trade-in allowance made to him his old machine cost him less than \$5 per year! No wonder he is convinced that "NEW IDEA quality pays". Countless other farmers have made the same discovery. Records show that repair costs on our famous Model 8 average only 25c per year. No machine has ever excelled it in performance—and it is good for a lifetime of hardest use.

Hay Tools of Proven Worth

THE cleanest haying work you ever saw—and no breakdowns! That's what you get with these tested SANDWICH-NEW IDEA Hay Tools. Modern all-metal construction. Roller bearings; light draft. Combination Rake and Tedder, entirely controlled by levers reached from driving seat. Meets all conditions of ground and crop.

New Idea Transplanter saves time and labor. Thoroughly modern. Handles all transplantable crops and root settings.

Easyway Hay Loader has cylinder pick-up and push-bar elevator. Gets the hay but does not dig the ground. Saves the leaves and heads. See your dealer or write for information.

Reviewing the Markets

Milk Prices March Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		
2A Fluid Cream	1.66	
2B Cond. Milk		
Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
Hard Cheese	1.50	1.30
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for March 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

February Milk Prices Announced

The Dairymen's League announces the following prices for Feb. for 3.5% milk:

Gross	\$2.06
Expenses	.06
Net Pool	2.00
Certificate of Indebtedness	1.04
Net cash to farmers	1.90

	Cash Price 3.5 Milk	Pool Price 3.5 Milk
February 1930	2.36	2.51
February 1929	2.87	2.97
February 1928	2.70	2.80
February 1927	2.57	2.67

Sheffield producers announce cash prices to farmers for 3% grade B milk in the 201 to 210 mile zone as \$2.00½, per hundred (\$2.20½ for 3.5% milk).

	3% Milk	3.5% Milk
February 1930	2.51½	2.71½
February 1929	2.82½	3.02½
February 1928	2.67½	2.87½
February 1927	2.54	2.74

Butter Steps Upward

CREAMERY SALTED	Mar. 13, 1931	Mar. 7, 1931	Mar. 14, 1930
Higher than extra	30½-31	29¼-29¾	38½-39
Extra (92 se.)	30 -	28¾ -	-38
84-91 score	25½-29½	24½-28½	31 -37½
Lower Grades	23½-25	23 -24	29 -30

The butter market has continued its up and down tactics that have been so characteristic of the trade for the past several weeks. On Monday, there was a slightly easier feeling at the opening but a slight price concession held the market firm. Strong advices from the West following the severe storms that have recently swept the producing areas helped the firmness. On Tuesday the market gained and jumped from 28½c to 29c making up all the loss and netting a gain. The firmness continued on Wednesday and creamery extras went to 29½c. There was some opposition to this advance, many operators fearing the market was being advanced too rapidly. Their fears were justified for it was quite evident the advance strained the market. On Thursday, with plenty of stock on hand and considerable carry-over, the market broke a half cent. However, Friday they were back at it again and with outside speculative demand increasing, creamery extras went up to 30c. As a matter of fact, on Friday there was a spectacular fifteen minutes of trading when creamery extras went up to 30½c. The market officially, however, was credited with 30c. The regular buyers refused to go along with the market except to meet very pressing immediate needs. As the market comes to a close it is easier to buy than to sell creamery extras at 30c, and it is very likely that we will see a softening of values. However, the statistical condition of the market would warrant prices holding steady. On March 1, U. S. storage stocks totaled 30,595,000 pounds whereas on March 1, 1930, U. S. storage stocks totaled 46,535,000 pounds. From February 1 to March 1 U. S. storage stocks were reduced 16,197,000 pounds whereas during the same period last year U. S. storage stocks were reduced 13,700,000 pounds.

Firmer Tone in Cheese Market

STATE FLATS	Mar. 13, 1931	Mar. 7, 1931	Mar. 14, 1930
Fresh Fancy	16-17	16-17	18½-
Fresh Average			
Held Fancy	21-22½	21-22½	24 -26
Held Average			23 -

Although prices of cheese in the wholesale market show no change from a week ago there is an undercurrent that is unmistakably better. There is a much improved demand for well cured cheese from New York and Wisconsin. These closer clearances coupled with a firmer western market give us a stronger tone here. Although there have been no price ad-

vances, there is an unmistakable upward trend that is expected to net higher figures. Only a limited amount of fresh cheese is available from New York which is working out at unchanged prices. On March 1, U. S. storage stocks totaled 47,884,000 pounds, compared with 47,818,000 pounds on the same day a year ago. From February 1 to March 1 holdings of U. S. storage stocks were reduced 6,615,000 pounds whereas during the same period last year holdings were reduced 5,854,000 pounds.

Western Storms Help Egg Market

NEARBY WHITE	Mar. 13, 1931	Mar. 7, 1931	Mar. 14, 1930
Hennery			
Selected Extras	26½-28	25½-26½	32 -
Average Extras	24½-25	24	29 -30
Extra Firsts	23½-24	23 -23½	28 -28½
Firsts	22½-23	21½-22	26½-27½
Undergrades		20 -21	
Pulleys			
Pewees			
NEARBY BROWNS			
Hennery	26 -27½	24 -26	29½-31
Gathered	22½-25½	20 -23½	26½-29

The severe storms that swept the West during the first week in March have materially benefitted the egg market. Prices have gained steadily. At this writing, just before the close of the market, the intermediate and cheaper qualities were meeting the more active demand, prices on which were being pushed up to the better values. These classifications have been very scarce of late. They have crowded those grades just below the choicest.

The severe storms of other years have not been so common to our Western producing areas and they have been able to maintain relatively high and uninterrupted production. These recent storms have broken up the steady flow of eggs and it may be some time before the hens get back on their feet. This check in the production has naturally benefitted the Eastern producer. On March 1 U. S. storage stocks totaled 407,000 cases of eggs whereas on the same day a year ago holdings were 84,000 cases.

Live Fowls Selling Better

FOWLS	Mar. 13, 1931	Mar. 7, 1931	Mar. 14, 1930
Colored	23-25	-21	27-29
Leghorn	21-22	17-19	-30
CHICKENS			
Colored	24-29	24-29	26-27
Leghorn	21-23	21-23	26-27
BROILERS			
Colored	33-40	30-40	25-45
Leghorn	34-37	35-37	40-42
OLD ROOSTERS	15-16	15-16	-20
CAPONS	38-42	38-42	37-40
TURKEYS	30-40	25-40	30-42
DUCKS, Nearby	23-25	24-27	24-26
GESE	-15	16-17	-18

Live fowls have shown considerable improvement this week. Supplies have not been over-heavy and demand has shown improvement. All other lines of live poultry appear to be holding well.

Attention is called to the Hebrew holiday, April 2 and 3, when fat fowls, ducks, geese and turkeys will be the most in demand. The best market days will be March 30 and 31. Only choice stock is wanted and time your shipments so that they will arrive on the best days. Avoid having them arrive too late on the last day.

Meats and Livestock

CATTLE—Two loads medium steers steady to 25c higher at 8.00-8.25. Cows steady, largely of Vermont origin, common to medium \$4.00-5.00. Bulk of run consisting of low cutters and cutters from 1.75-3.50.

VEALERS—Steady. Light supply largely of New York origin. Good to choice 9.50-12.00, medium 7.50-9.00, cull and common 4.50-7.00.

HOGS—Around 25c higher. Good to choice 160-220 lbs. 8.50-8.75, few medium 8.00.

COUNTRY DRESSED CALVES—Receipts liberal during the week. Demand slow in early part improving towards end of week at better prices. Market closed steady and cleaning up on Friday. Fresh receipts per pound: Choice, 12-13c; fair to good 10-12c; small to medium 6-10c.

HOTHOUSE LAMBS—Receipts moderate to liberal during the week. Demand slow and for fancy only. Undergrades hard sellers some carried over daily. Market closed weak unchanged from last week. Good to fancy, each 8.00-10.00; fair to good 6.00-8.00; imitations, each 2.00-5.00.

THE REAPER TAKES FORM

The McCormick Farm in Virginia, 1831 A. D.

Cyrus Hall McCormick builds into his great invention the seven basic principles that are to be found in the grain harvesting machines of today, including the harvester-thresher or combine.

INTERNATIONAL HARVESTER

CELEBRATES

The Invention of the Reaper

ONE hundred years ago, in the harvest time of 1831, Cyrus Hall McCormick gave the world the first successful reaper.

In the valley of Virginia the men of the McCormick clan, Robert the father and Cyrus the son, dreamed a dream that men might free themselves from the drudgery of the harvest. It was a dream as old as legend; a dream that seemed as hopeless as the quest for eternal youth. Countless numbers had sought to turn the dream into reality, and all had failed. In all the ages, only the scythe and the cradle had joined the sickle and the reaping hook to ease the toil of men in the harvest fields, and in none of these dwelt the magic of the machine. The patent office archives were thronged with dead hopes and with memories of harvesting machines that would not work. None, until McCormick, found the key to the mechanized harvest.

The place of Robert McCormick, the father, in the history of the reaper is not that his own dream failed but that his inventive pioneering inspired the genius of the son. So that in the brief span of six

weeks of fevered labor at the anvil in the farmstead blacksmith shop Cyrus Hall McCormick created the machine that will hold its place for all time among the premier inventions of the world.

No sign from the heavens attended the first public test of the reaper on that July day of 1831. Only a mild stir went round the countryside. But this machine marched swiftly through the grain, cutting as much as a score of men could cut with reaping

hooks in Caesar's time—or in the time of McCormick! Its mission was secure. Its field was all the earth. A brilliant future lay before the reaper, and the conquest of the harvest was at hand.

Two decades later, when the Royal Commissioners of the Great World's Fair at London, England, awarded the Council Medal to Cyrus Hall McCormick for his invention, the London Times paid tribute in these words: "The reaping machine from the United States is the most valuable contribution from abroad to the stock of our previous knowledge that we have yet discovered," and Edmund Burke, United States Commissioner of Patents, in the same period wrote of the reaper, "It is one of those great and valuable inventions which commence a new era in the progress of improvement and whose beneficial influence is felt in all coming time."

Such is McCormick's invention of the reaper, an event that was to affect profoundly the progress of the human race. Such is the event from which the International Harvester

Company is proud to be descended.

1831 • CENTENNIAL OF THE MCCORMICK REAPER • 1931

INTERNATIONAL HARVESTER COMPANY, CHICAGO, U. S. A.

It's a Great Day *When the New Stove Arrives!*

Everybody's happy—the new stove is something worthwhile celebrating. The family sees big times ahead at the table with tempting new dishes in store—and proudly notices how this handsome piece of furniture brightens up the kitchen.

Best of all, it means that mother will have more time for leisure. No more struggling with the old-timer that wore itself out in service—no more fussing with pesky doors that don't fit—no more messing with brush and blacking.

Cooking will be a pleasure for her on this up-to-date stove

with its many conveniences. She has been longing for the chance to try new recipes in an oven that heats quickly and evenly—and can easily be regulated. Now this wish has come true.

How old is the stove on which the mother of your household has to prepare 1095 meals a year? Isn't it high time you thought about replacing it with one which is modern and convenient?

Stoves and Automobiles are Constantly Improved

A 15-year old stove is just as much out of date as a 1916 car. You wouldn't be satisfied to drive such an antiquated model, so why expect your wife to struggle along with a stove that is just as ancient? Next time you are in town look at the new stove models—you will be amazed at all the improvements which have been added.

Don't look on a new stove as an expense. It is an investment that pays dividends three times a day.

Only Dependable Stoves Are Advertised in This Paper

Chevrolet offers two 1½-ton trucks of unusual value »

in 131- and 157-inch wheelbases

Chevrolet truck with Stake Body on 131" chassis

For the efficient, economical hauling of 1½-ton loads, Chevrolet offers two six-cylinder trucks

of unusual power and stamina, and full-size carrying capacity.

There is a 131-inch wheelbase model, with a 50-horsepower six-cylinder engine, dual rear wheels, four-speed transmission, and many other features that add to performance, reliability and long life. For bulky loads, there is a 157-inch model, with all these same features, combined with extra-long wheelbase and a heavier, deeper frame.

Because of full-length frames, which support the bodies throughout their entire length, you can mount bodies of unusual size and capacity

on these Chevrolet chassis—a nine-foot body on the 131-inch model, and a twelve-foot body on the 157-inch.

And you can buy either of these trucks complete with a Chevrolet body, designed by Chevrolet engineers, built in Chevrolet plants to Chevrolet's high standards of quality, ruggedness and durability.

If you have stock or produce to be hauled to market—or goods to be carried anywhere—you will find real satisfaction in entrusting the work to a big 1½-ton Chevrolet. Everything that goes to make a truck useful and profitable—power, speed, dependability, economy, ample load-space—is combined in these trucks at prices that set them apart as great values.

CHEVROLET SIX CYLINDER TRUCKS

Fisher Craftsmanship Guarantees Comfort, Durability and Style to the New Pontiac Six

A glance at the new Pontiac Six with Body by Fisher will tell you that it is a stylish, good-looking car. And you can buy it with confidence that it will retain its fine appearance.

For every Body by Fisher is built to give the utmost durability, comfort, and safety under the most severe driving conditions.

Fisher assures this by building bodies of composite wood-and-steel construction—the finest type known to the body building art—construction in which a staunch framework of seasoned

hardwood, rigidly reinforced with metal braces, supports strong steel panels.

Fisher roofs are the sturdy and substantial bow-and-slat type of construction. Fisher finish is durable. Fisher upholstery fabrics are of pleasing design and high quality and are known for their long wear.

Only in the Pontiac Six, in its price field, can you obtain Fisher high value and long life and the many Fisher features that add to comfort and safety. For Pontiac is one of the General Motors cars—the *only* cars with Body by Fisher.

FISHER BODY CORPORATION, DETROIT, MICHIGAN

Division of General Motors

Sturdy roof construction

Rigid braces of heavy steel (1) secure the roof to the body frame of every Pontiac and Oakland closed car. Strong steel corner braces (2) reinforce the entire body structure. And there is no other type of roof construction so safe and sturdy as the Fisher, bow-and-slat type. (3) Be sure to get strength, stability, and safety in the body of your car.

Spacious and inviting interiors

Inspect the interior thoroughly. In Oakland and Pontiac Bodies by Fisher, you find generous roominess, luxurious comfort, elegance. High grade upholstery fabrics are used throughout—for side and head linings as well as for seat cushions. And note the restful comfort of these cushions—Fisher controls exclusively the new type springs which prevent sagging, and are so comfortable.

Strong body panels

Here are the body panels as Fisher makes them—in large, strong units with all mouldings and window reveals formed directly in the metal, not nailed on. Thus, the front pillar cover (1) is formed in a single piece. There are no mouldings to work loose, no exposed joints to open. Compare this construction on a Pontiac or Oakland with other cars in its price field.

Farm News from New York

Master Farmers to Visit WGY---Governor Signs Produce Grading Law

NEW YORK State Master Farmers and their wives, the members of the Board of Master Farmer Judges, and the Staff of American Agriculturist have been invited to visit the General Electric Company's plant at Schenectady, on Wednesday, March 25. Up to date about twenty-five Master farmers have accepted the invitation.

The General Electric Company has a marvelous experimental plant, originally made famous by Steinmetz, known all over the world as an electrical wizard. A special program and demonstrations have been planned for the entertainment of the Master Farmers.

In place of part of the daily agricultural program, a special broadcast will be put on from Station WGY between 12:30 and 12:45. Master Farmers and members of the A. A. Staff will at that time tell you some of the wonders seen during the trip through the plant.

Following lunch, which will be served at the General Electric plant, busses will take Master Farmers and other guests to Albany where they will meet the legislative leaders and at 5 o'clock they will be entertained by Governor Roosevelt at the Executive Mansion.

Grading Bill Now a Law

GOVERNOR ROOSEVELT has signed the farm products grading bill, which is expected to furnish strong support to the farmers of the state in their efforts to compete more successfully with products from the west and south which come onto the New York markets. In addition, it is designed to supply the consumers of the state with farm products of better and more uniform quality. The bill introduced at the request of Commissioner of Agriculture Berne A. Pyrke, empowers the Commissioner after public hearings to establish official definitions and standards for grading farm products of all sorts, requirements for which are not to be lowered in any case than those for United States grades.

The new grades are to be permissive. Growers will not be required to adopt them, but when they do adopt them for the purpose of gaining greater marketability for their produce, they will be held to full accountability for maintaining the standards of the grades labeled on their containers. There is provision in the bill for special definition of culls and authority for regulating their labeling and shipment. This is to meet the complaint of growers, dealers and consumers alike that products properly classified as "culls" have been coming on the market mixed with more salable fruits and vegetables and thus have been doing injury to the reputation of New York state products.

Primary demand for the new legislation came from potato growers and dealers and it is thought probable that the first public hearings under the bill will deal with this crop, with hearings on other vegetables and fruits and the establishment of New York State grades and standards to follow.

An important feature of the bill is that its permissive character will not require a large force of inspectors to administer it, but occasional inspection of the products offered for sale will suffice to hold producers strictly to the grades they are advertising.

League Buys New Plants

THE Dairymen's League has recently acquired the following plants in Northern New York and Vermont, which will undoubtedly affect the future of the milk shed to some extent.

The following plants in Vermont—Bristol, Brandon, Rutland, Leicester Junction, Danby, and Orwell, and in New York—Johnsonville and Greenwich, were purchased.

It is the plan of the League to eventually operate only a few of these plants as the territory can best be served in that way.

Farmers in the territory have been shipping to the Boston market and the shift to New York will make a difference

in the proposed plans of the co-operative companies serving Boston and other New England states.

Borden Company Expands

AN item of interest to dairymen in the New York Milk Shed is an application made by the Borden Company last Wednesday for the listing of additional shares of capital stock. This stock is to be issued for the Niagara United Dairies of Niagara Falls, N. Y. the Anona Cheese Company of Chicago, Ill., and the Norwalk Dairy Company of Bridgeport, Conn. The Borden Company seems to be expanding operations quite rapidly and just how it will affect dairymen of the milk shed is a question. It is to be hoped that the acquisition of the new plants will aid in the reducing of the distributing cost of milk and milk products which the present situation sadly needs.

Trespass Law Discussed

AT a recent meeting of the Advisory Council for the Conservation Department, the question of farm trespassing was discussed in considerable detail. After an examination of the trespassing laws of other states, the council expressed the sentiment of being in favor of expanding the present New York State Posting Law to include all forms of trespassing on farms.

The present posting law, designed to regulate hunters and fishermen, can only be made effective when it is adequately enforced. If the law is broadened to include all trespassing and if it is strictly enforced, it will go a long way to solve the serious trespass problem in the rural counties, especially those near the large cities.

Health Essay Contest

J. A. Lennox, County Club Agent of J. Delaware County, announces a health essay contest for high school students. The essays are to be five hundred words in length and are to be in the hands of the respective principals of each high school by April 30. The first prize in each town will be \$2.50 while the county offers a first prize of \$5.00, second, \$2.50, and third, \$2.00, and in addition, the first prize winner, if a club member, will receive a free week at Shankitunk 4-H camp.

Any subject related to health will be acceptable.

Radio News Over WHAM

DON'T forget our new feature being broadcast over WHAM at Rochester, daily, from 12:10 to 12:15 noon. Editor "Ed" will write on something of editorial interest on Tuesdays and Saturdays.

News of interest to the Western New York farmer prepared by the editorial staff of the American Agriculturist will be broadcast on Monday, Wednesday and Friday, and Aunt Janet will devote a five-minute period to the home makers on Thursday.

We will be very glad to get your comments and suggestions as to the type of information you enjoy most.

New York Farmers Aid Drought Victims

MUCH credit is due L. R. Simons, State County Agent Leader, who in cooperation with the County Agricultural Agents, has made splendid progress in the shipment of produce to the drought-stricken areas of the South.

More than thirty cars of produce have been loaded from New York counties and with the exception of probably twenty more, the work is still going forward.

A telegram from John Barton Paine, Chairman of the American Red Cross, to Mr. Simons gives the sentiment of those that are receiving the assistance—"We are delighted with the splendid response to campaign. These supplies will be of material assistance to our chapters in meeting the needs of thousands of farmers in West Virginia, Kentucky and Tennessee, who lost their crops and are

in need of relief". Governor Roosevelt also wired his congratulations to Mr. Simons on the splendid work being done by the farmers of the state.

Monroe County reports the loading of five cars and possibly more this week. H. W. Pease of Ontario County, reports the Home Bureau and Junior Extension Workers co-operating and shipping instructions for 4 cars have been received. Excellent cooperation has been secured from all departments in this world effort. The farmers of New York who although in many cases, hard hit themselves, have responded to the call in a very commendable manner.

What the Hoosick Falls Young Farmers' Club is Doing

THE Young Farmers' Association of Hoosick Falls, N. Y. has held two meetings in 1931. The first meeting, a business meeting, was held at noon (12 M—1 P. M.) on January seventh. The following officers were elected:

President, Harold Jones; Vice-President, Grante Sharpe; Secretary and Treasurer, Varnum S. Stearns, Jr., Chairman of Refreshment Committee for 1931, Otto Pirtitz.

January twenty-second was the date set for the regular monthly meeting. At this meeting, which was held at 7:30 P. M., a group of objectives was worked out by members of the association and were passed around to each member to be voted upon. They were accepted by a majority vote and were duly signed by said officers.

The Dairy Herd Improvement Plan was discussed at this meeting. The association has bought scales and other accessories which are to be loaned to the members. The members are to weigh the milk from each cow in his or his father's herd at least once a month, then samples

are taken to the farm shop in the high school where they are tested for butterfat (by Babcock test method), each member practising his own work under the supervision of Professor Ralph S. Bullock, head of the agricultural department, who is also the club's head adviser. Each member is to keep all necessary records on his herd. It is expected that this will prove to the member the value of keeping records on his herd and will be a wonderful source of education.

The speakers of the evening of January twenty-second were Earl Bennett, who spoke on "The Advantages of Keeping Milk Production Records", and Professor R. S. Bullock who told about the Dairy Herd Improvement Plan. A spelling bee was held, after which refreshments were served.—Vernum Stearns, Jr., Hoosick Falls, New York.

Western New York Notes

WESTERN New York's brand new egg-laying contest plant at Stafford, Genesee County, will be ready in October for the opening of the big contest with Professor Robert C. Ogle, Department of Poultry Industry, Cornell University, Contest Director.

4-H club work in Erie County is being launched by its new leader, John D. Walker.

The Western New York Butter and Cheese Maker's Association held its 22nd annual meeting at Cuba, March 12.

Saturday, March 7, twenty-four fishermen were rescued from two ice floes in Lake Erie, 15 miles south of Buffalo.

About 40 fishermen were trapped on similar floes on February 8 and not until February 10, were the last of them finally rescued.

With the advent of March, we have more snow and winter weather.

There seems to be some demand for hay, at from \$15 to \$20.

Potato, butter, and egg prices low.

Poultry Farmer

Brooding the Farm Flock by Electricity

THE farm flock of poultry is often the source of many of the little extras which the farmer's wife and indeed her entire family enjoy. Often the farm flock becomes so large that it produces a large part of the farm income. Most of our farms have a small poultry house where the farmer, the farmer's wife or in some cases, the children keep from 50 to 500 hens. No one can dispute that this is an economic side line when properly handled. It is often a problem in the spring of the year when everyone on the farm is very busy to give proper attention to raising the baby chicks to replace the old birds which must be culled from the laying flock.

Mrs. Arthur Shaver, of Eagle Mills, N. Y., has simplified this problem. The Shavers live on a dairy farm. The milk is bottled on the farm and retailed in Troy, N. Y. Mrs. Shaver has kept a small farm flock and like most far-

A hover heated by electricity. Note that the walls are covered with insulating material to conserve heat.

mers' wives did not find enough time to care for the ordinary type of brooder.

When an electric brooder was installed, Mrs. Shaver found that she did not have to give the heat any attention. The chicks were always warm and comfortable. There were no foul gases for the chicks to breathe.

The electric brooder was housed in a small colony house with double walls. The space between the walls was filled with sawdust. The open front was covered with cheese cloth to prevent drafts.

The first brooder was tried under the supervision of the local power company's Rural Service Department. This brooder was so successful that another brooder was added the first season.

During the present season, Mrs. Shaver intends to raise several broods of chicks. The first brood started in January, and later broods at intervals of three weeks. Most of these birds will be dressed on the farm, and sold on the retail milk route, some of the best pullets being saved to replace the culls from the farm flock.

This example of electric brooding shows a method of eliminating considerable work and worry from the busy spring days. The cost of operation of a well made electric brooder will be about 3 cents per chick on a 3 cent rate.

After studying the operation of the electric brooders on Shaver's Farm, I would say that success was based on selecting the proper brooder, following instructions in its operation, having a house well ventilated but free from drafts, and giving the birds proper feed.

In selecting a brooder one should

consider ventilation, capacity and construction. Provision should be made for adjustable ventilation in order that chicks may be supplied with plenty of fresh air when under the hover at night. Ventilation may be restricted during the day to conserve heat when the chicks are running about the house. The brooder should be large enough so that each chick has at least 7 square inches of floor space—more might be better. The brooder should be well constructed and properly insulated. Long-lived heating coils and a good thermostat are essential.—A. J. Van Schoick.

Watch Brooder Temperatures

PROPER temperature protects health and promotes uniform growth of chicks. Uncomfortable chicks refuse to eat and unhealthy chicks fail to digest properly what they do eat. We recommend for the first week a temperature of not less than 95 degrees, one inch above the floor at the edge of the hover. The poultryman with little or no experience in brooding should use a thermometer to check temperature conditions. Active and happy chicks give the best evidence that temperature is right.

If an attempt is made to care for more than 300 chicks under one of the smaller coal-burning stoves (up to 50-inch hover), the temperature may well be increased to 100 degrees, provided there is sufficient floor space for chicks to spread out. Care must be taken to teach chicks where to go for warmth. This is best done by confining them for two or three nights within a circle of inch-mesh wire about 18 inches outside the hover rim. After this they may have the run of the house and will choose the heat zone they prefer.

It is not desirable to keep the entire pen warm. A wide range of temperature, with ample heat near the stove, encourages exercise and benefits the chicks. Open windows in the front of the house admit direct sunlight and improve ventilation, keeping the litter dry and the air fresh. Chicks raised under such conditions eat more, feather better, develop more uniformly and harden off with less trouble.

Hover temperature may be reduced about five degrees a week. If chicks are permitted outdoors, on the ground or on a platform, it will be safer to confine them near the entrance until they have learned how to get into the house.

It is well to visit the brooder house at least once during the evening to make sure that all the chicks are comfortable and the stove has sufficient coal for the night.

The use of dim lights all night in the brooder house helps prevent crowding and permits chicks to eat and drink whenever they desire.

LOCKE JAMES

Care of Hatching Eggs

CLEANLINESS in the breeding pen has a very direct influence upon the number of clean usable hatching eggs produced. Eggs intended for hatching cannot be washed without impairing their hatching qualities and dirty eggs do not hatch well.

The nests, of course, require clean nesting material at frequent intervals but the mistake often made is that of waiting until the material becomes dirty before changing rather than adding more as soon as the nest becomes thin at the center. Insufficient covering over the bottom of the nest is the cause of a large number of broken eggs in the nest. The remaining eggs in such a nest readily become smeared with the contents of a broken egg and are

What's Doing This Year At Albany

(Continued from Page 1)

year auto license for farmers and others who do not use their cars in the winter time. American Agriculturist has worked steadfastly for the passage of such a law for two years. We are informed that there is not much chance to get it through this year because of a shortage of State money necessary to carry on the State work already pledged.

Individual farmers and farm organizations must make more of an issue of this injustice before it will be corrected.

School-Money Fees to Supervisors

Sad to relate, the Assembly has defeated the bill which would have saved the taxpayers in the towns over a hundred thousand dollars a year now paid to supervisors for a service not rendered. This situation is one to which every rural taxpayer should give careful attention, for there is absolutely no excuse for supervisors receiving this money at the expense of their friends and neighbors. Ask your supervisor about this. (See editorial in this issue on this subject.)

Bill Against Imitation Butter

—MR. SMITH, Assembly, 612.

This bill is similar to the one just passed by Congress prohibiting the sale of oleomargarine which is colored to imitate butter.

An important provision of the bill reads, "Within the meaning of the provisions of this article, oleomargarine or any similar substance shall be deemed conclusively to be in imitation of butter when it has a color similar to the color of butter." If you believe this is a good bill write Mr. Smith.

To Control the Quality of Agricultural Poisons

—MR. KIRKLAND, Senate, 1131.

This provides for the licensing of insecticides and fungicides and other substances for destroying or controlling insects, fungi, bacteria, weeds, or rodents. Its chief purpose is to prevent the adulteration or misbranding of these poisons.

We hope this bill will be passed, as it is in line with other policies and legislation to improve the quality of farm supplies.

To Establish Regional Markets Under State Control

—MR. SANDBERG, Assembly, 272.

This proposal reads in part as follows: "It is hereby declared to be the policy of the State to provide as soon as practical for the establishment of a comprehensive, state-wide system of regional markets for the purpose . . . of providing suitable outlets for the products of farms . . . and of decreasing food costs to consumers . . . Such markets shall be owned either by the State or jointly by State and city or jointly by State and one or more counties . . . and shall be under the direction of the Department of Agriculture and Markets."

The purpose of the bill is to provide for the study of the needs of several localities for such markets and the purchase of an option or two for the first market. This is one of the most important measures before the Legislature this year from the farmers' standpoint.

Compensation Law for Logging and Wood-Cutting Operations

—MR. PORTER, Assembly, 1135.

We have already called attention to this important bill in last week's issue. It provides for exempting farmers from the provisions of the Compensation Law when farmers wish to cut and sell off from the farm a little wood

or lumber. It is an extremely important bill.

To Give Threshers and Ensilage Cutters Liens on Grain or Ensilage

—MR. RILEY, Assembly, 620.

This interesting bill would insure threshers and ensilage cutters liens on products which they prepare for farmers in case farmers fail to pay for this service.

Changing Qualifications of District Superintendents of Schools

—MR. BRERETON, Senate, 1033.

Under the present law, district superintendents of schools have to pass an examination in agriculture before they qualify for an appointment. This bill would do away with this qualification. It is claimed that the examinations in agriculture heretofore have not been very practical. Nevertheless, this important qualification should not be removed. Every district superintendent of schools, all of whom preside over rural districts, should certainly have some training in agriculture.

To Provide New Farm-to-Market Roads

—MR. ABBOTT, Assembly, 293.

The chief purpose of this bill is to provide a bond issue for establishing

LAKEVIEW FARMS
M. M. CASS, PROPRIETOR
DAIRY, FRUIT AND POULTRY PRODUCTS
WATKINS, N. Y.

Watkins Glen, N. Y., Feb. 12, 1931

The Tanglefoot Co.,

Grand Rapids, Mich.

Gentlemen:- No doubt this may be rather unusual procedure, but I am writing you to say that your Tanglefoot fly spray for cattle is also the greatest cattle lice killer on the market.

Perhaps you know this, and perhaps not, but if not I am letting you know that you have an all year around product.

This fall I had some of the spray left over, and after trying every available product on the market to rid cattle of lice I used some of your spray in desperation, and there has not been a sign of lice since. I now use it every week as a preventative rather than a cure.

Yours Resp't.

M. M. Cass

Mr. Cass also uses Tanglefoot Stock Spray on his cattle in the summer for killing and repelling flies with equal success.

Tanglefoot Stock Spray has no equal as an insecticide for dairy and general farm use.

Practically odorless—never taints milk—won't stain—can't hurt animals.

Satisfaction is guaranteed • Order today from your dealer • Write for free interesting booklet

THE TANGLEFOOT CO.
Grand Rapids, Michigan

TANGLEFOOT STOCK SPRAY

a great state-wide farm-to-market road system which would include the better town roads. Such a system would be similar to the present State and county system. It is said that the bill has no possibility of passing this year, but the principle upon which it is founded is right, and sooner or later the Senate must get back of a plan to advance the interests of dirt road farmers.

Hewitt Reforestation Amendment

A reforestation commission was created in 1928. After thorough study, two bills were introduced and passed by the Legislature in 1929. The first of these provides for State aid to counties on a fifty-fifty basis—that is, the State to pay half and the county to pay half in the purchase and reforestation of five hundred acres or more in a single plot. The second bill provides for the buying and reforesting under State management of lands outside of the forest preserve counties.

Reforestation is going forward in fine shape under both of these acts.

The commission also recommended a constitutional amendment calling for the expenditure of twenty million dollars over a long period for the reforestation of vast acres of idle land not suitable for farming, to be managed with scientific forest practices to grow timber for the future, to regulate stream flow, to protect all water sup-

plies, to provide for recreation, hunting, and fishing. This suggestion is known as the Hewitt Amendment. All amendments have to be passed twice by the Legislature and then submitted to the people. The Hewitt Amendment was passed by the Legislature of 1930. It is expected that it will be passed again this year and will be submitted to the people of the State at the election in November, 1931.

If this amendment finally becomes part of the Constitution New York will have a reforestation program equaled by no country or state in the world.

* * *

The foregoing is a short, bird's-eye view of the legislative situation so far as agriculture is concerned in New York State. The session will close the last of this month or early in April, so if you are going to take any action relative to any of the above bills you would like to see passed, you will need to do so immediately. Remember, in this connection, that city people always do express themselves. Farmers seldom do.

When one considers the convenience of automatic control, the absence of smoke and noise, the reduction in fire hazard, and the certainty of instant and dependable service, together with moderate costs for current, electricity stands out as the farmer's best "hired man."

BABY CHICKS

KERR'S NEW LOW PRICES

PLACE your order now for Kerr's Lively Chicks. These prices are attractive for chicks that have a rich laying inheritance from birds that have made big records in leading egg-laying contests.

	UTILITY CHICKS

(Continued from Page 18)
rendered unsuitable for hatching purposes.

Shavings make ideal nesting material. Excelsior is frequently used, although it is not convenient to remove eggs from such a nest as a great deal of material is usually caught in the fingers.

If straw is used, the birds make a nest in which the center is bare, thereby causing broken eggs.

Either daily cleaning of drop boards or the wiring of roosts to keep birds away from droppings must be practiced in order to eliminate the carrying of this filth on the feet of the birds from drop boards to nests and hatching eggs.

Wet or damp floors occasioned by rain or snow beating in through the front of the pen is another indirect source of dirt on eggs. Many poultrymen do not consider it important to clean perches in front of nests, feed hoppers, and water containers but these small areas get just as dirty as the drop boards and frequent cleaning is necessary to produce clean hatching eggs. Eggs intended for hatching should be gathered frequently during cold weather and stored in a cool place at a temperature of 50 or 60 degrees.

Cleanliness in the breeding pens means clean nest, clean drop boards, clean floors, and clean equipment.

C. D. ANDERSON.

The Night Light for Baby Chicks

THE favorable results secured by a large number of poultry raisers with the use of a dim light for baby chicks are being confirmed by experiments at the Massachusetts Agricultural College. Professor Wm. C. Sanctuary reports, that with 327 chicks under observation, the lighted chicks showed a gain in growth at four weeks of age which varied from 8 to 15 per cent depending upon the breed. This gain did not come from eating during the night but it was noted that the dim light kept the chicks spread out in the most comfortable sleeping belt available and enabled them to find their way back to the hover without becoming chilled. It was also observed that on cold mornings the lighted group of chicks lost no time before starting to drink and eat while a large portion of those in the unlighted group first took time off to get warm under the hover.

Where electricity is available either from a farm lighting plant or transmission line, a ten-watt light was recommended. This assures a dependable light which will not blow out or become an extra fire hazard.

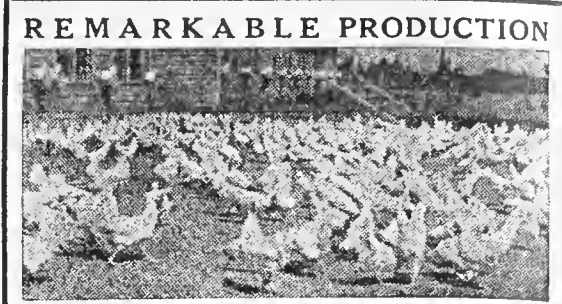

Advises Glass Substitutes

UNDER present conditions, when the problem of parasite control requires that chicks be confined to houses (where formerly they were allowed outdoors in the sunlight) it is necessary to provide adequate natural light within the house. Ordinary window glass does not permit the effective part of the sun's light (the ultra-violet rays) to pass, but there are now available several glass substitutes which will transmit these rays.

Glass substitutes are of several types. Some have a base of screen wire, others of cloth. There are also materials resembling window glass, but so made that the ultra-violet light will pass through; these would be commonly used if it were not for the high cost.

Most of the materials on the market have been subjected to tests by experiment stations, to determine their efficiency in maintaining proper health and growth.

duct will be glad to refer the buyer to results of such tests, which give the most dependable information regarding the effectiveness of the material.

To give growing chicks every advantage, ordinary window glass in the brooder house windows should be replaced by a dependable glass substitute, and if possible, chicks should be encouraged to get outdoors in the sunshine.
 —LOCKE JAMES.

Two New Poultry Books

TWO books of interest to poultrymen have just been published by the Orange Judd Publishing Company, 15 East 26th Street, New York City. One is "How to Select the Laying Hen" by H. M. Lamon and J. W. Kinghorne. This book, which costs \$1.25, gives in simple language directions for picking out pullets that will become good layers and for culling non-producers out of the flock.

The other is entitled, "Battery Brooding" by Milton H. Arndt, and sells for \$2.00. For the past year or two, there has been much interest in battery brooding of chicks; that is, in raising them confined in coops built up one above the other, and not letting them on the floor or ground until they have reached considerable size. This book will give you the latest experience and information on this method of raising chicks.

Answers to "Try These on Each Other"

The MAYTAG Roller Water Remover

WITH DIVIDED ROLLS AN OUTSTANDING FEATURE

Available with electric motor for homes with electricity.

MODEL "B"

CHURN AND MEAT GRINDER Attachments may be had for the Model B washer at reasonable extra cost.

EXCLUSIVELY Maytag—the roller water remover is superior to all other methods of wringing or water removal. It is specially appreciated on big farm washings.

Lift the tension release and the rolls may be instantly spread five and a half inches between centers—obvious safety and convenience. The top roll is *flexible*, the lower one *firm*—both oversize. Garments are wrung evenly dry and every last particle of dirt or soap flushed out. Buttons pass through safely. The drain is enclosed and reverses automatically. The rolls cannot revolve unless the roller water remover is locked in one of its seven different positions.

PHONE or WRITE the nearest Maytag dealer. Ask about the Maytag free home trial and easy divided payment plan. If the Maytag doesn't sell itself, don't keep it.

THE MAYTAG COMPANY
NEWTON Founded 1893 IOWA

MAYTAG NOW MAKES A WASHER MODEL "G" (NOT ILLUSTRATED) THAT SELLS FOR LESS THAN \$130

THE GASOLINE MULTI-MOTOR is the result of sixteen years development—a sturdy, modern engine built by Maytag especially for washer power—compact as an electric motor—only four working parts. A woman can start and operate it.

Flowers

The Table Centerpiece

THE flower centerpiece on the dining table is a sure indication whether or not a hostess is "on to her job." The object of any decoration is to add interest, and, if it does not do this, it is an absolute failure.

If it obstructs the view from one guest to another it has not fulfilled its purpose. Fifteen inches is about the limit as to the height of any floral decoration in the center of the table. Each flower should be perfect because it will be viewed at close range. Foliage of the same species harmonizes best with any flower, but often it is not possible to obtain it. This requires judgment and oftentimes in the home garden, where one has to take what she can get, substitutions must be made. A woman who loves flowers often has ferns from which she can cut the necessary green fronds to fill out her table decorations. The asparagus fern or springerli is often used in this way, although its drooping character and its particular shade of

1381

EASTER RABBIT FAMILY NO. C1381 would thrill any child. It comes stamped for simple embroidery on washfast Venetian cloth in colors, green, coral or gold; the Mamma Bunny holding a basket of eggs, is 25 inches high when finished and the little bunnies are about 17 inches, 14 inches and 11 inches respectively. Price for stamped material, 50 cents. If floss is desired for embroidery, add 50 cents extra. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

green may not harmonize perfectly with the flowers which are available.

Whatever flowers and greens are used, there should be some tie-up between them. That is why baby's breath, either of the annual or perennial variety, is so popular.

"Play Games and other Play Activities" has been prepared by Alfred B. Wegener, Director of Physical Education at Drew Theological Seminary. Mr. Wegener's interest in Athletics, games and recreational sports early led him to excel along these lines with the consequence that since twenty years of age he has been recreational director at some of the most important "Y's" in the country. Since 1914 he has directed the physical education and lectured on play at Drew University.

The book is classified according to Mr. Wegener's ideas of the types of play, is well indexed, and can be readily used either by teachers of physical education, field day committees, or by hostesses seeking to provide an evening's entertainment. For leaders of boys' and girls' groups, for camp directors, for entertainment committees of grange or church, this book would be very valuable. Abingdon Press, N. Y. C., \$2.00.

Spring Dreams

Rural Teacher Makes Her Own Come True

THREE of the happiest years of my life have been spent teaching a small rural school. Oh the glory of the out-of-doors! The unsightly site (or should I say sight) of a former wood-house has been converted into a flower bed. Just digging in the cool earth every spare moment—but to us it meant "Nature study"—"Physical training"—"Landscape gardening"! Clumps of wild violets formed a square border and these did not disappoint us, for they reappeared the next year in fresh, sweet fullness. Neighbors loved the project and donated seeds or plants.

Just as we love more the piece of clothing stitched by our own hands—so we, my pupils and I, have a deeper interest in the yellow rose bush sending forth new shoots each spring, in the crimson rambler which has not yet ramblled but gives its small verdant promise.

Perennials or annuals for flowers? I incline toward the permanent and abiding things of life, hence I choose perennials—flowers that will smile to greet other teachers, other pupils, and weary travelers along the dusty road. But I've started lilac bushes for those coming years and this year I'm longing for an immediate splash of color, just as my plants long for showers. I have a hedge of evergreens across the front of the school—those are permanent—they've "made good." Now, I've bought morning-glory seeds to form a beautiful arch over the doorway. All through the summer, people can watch new flowers smiling "Good morning" as they ride past to their work. I wish I could send you a picture of their beauty, their "glory", indeed, but at

this writing the snow still flies and my seeds cannot be even planted. Just spring dreams which, "volens Dei", will come true.

—Teacher, District School.

Tested Recipes

Oyster Shortcake

4 cupfuls flour	1/2 teaspoonful salt
4 teaspoonfuls baking powder	1 cupful thick cream
1/2 cupful butter	1 quart oysters
1/2 cupful milk	Pepper

Make a rich biscuit dough of the butter, half the salt, four cupfuls flour and the milk and bake in a round cake tin in a moderate oven. Blend four tablespoonfuls of flour with four tablespoon-

Attractive and Slenderizing

3038

Dress Pattern No. 3038 provides the slimming lines which the woman of heavier figure looks for in her designs. The bodice has a deep cross-over vest and softly falling jabots. The hip is fitted in a skirt yoke cut to the smartest depth. The popular fullness at the skirt bottom is achieved by a circular flounce. This pattern is attractive when made up in one of the pretty spring silks or in plain color combined with lace vestee and jabots of contrasting color. The pattern cuts in sizes 36, 38, 40, 42, 44, 46 and 48-inches bust measure. Size 36 requires 4 yards of 39-inch material with 3/4 yard of 39-inch contrasting and 1/4 yard of 39-inch all-over lace. Price 15c.

fuls of thick cream, season with salt and stir into the oysters cooking until the gills curl. Divide the cake into two parts and butter both. Spread half the oysters over the lower layer, put the second one over them and pour the remainder of the oysters and dressing over this. Blanket with the remainder of the thick cream well beaten and seasoned with salt and pepper and serve hot.—L.M.T.

Vines and climbing plants add charm and soften the hard lines of a house.

Bloomer Dress

3016

Bloomer Dress No. 3016 is in the best of taste for misses of 2, 4 and 6 years of age. It has real style, yet it is simple as children's clothes should be. The Peter Pan collar, the turn-back sleeve cuffs and knee bands of the bloomers provide a nice trim in plain colors, which set off the colored print. The frock and bloomers are made of cotton broadcloth. Pique, dimity, chambray, gingham, linen, dotted swiss, percale and shantung are all most attractive as well as most practical. The 4 year size requires 2 1/2 yards of 35-inch material with 1/2 yard of 35-inch contrasting and 2 3/4 yards of binding. Price 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. Add 12c for one of the Spring Catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

David cannot understand why his Lady of the Roses and Jack are not on good terms. His Lady tells him that none of her hours are happy ones, and when David tells this to Mr. Jack it seems to start him thinking.

When David fails to visit Jack and Jill and his "Lady of the Roses" for a week, they make inquiry and discover that David is dangerously ill.

When David is on the road to recovery all his friends visit him. Jack leaves suddenly by way of the window to avoid meeting the Lady of the Roses. On his next visit to David he could not avoid meeting her.

• • •

Even then disappointment was piled on disappointment, for Mr. Jack's visit was not the unalloyed happiness it usually was. Mr. Jack himself was almost cross at first, and then he was silent and restless, moving jerkily about the room in a way that disturbed David very much.

Mr. Jack had brought with him a book; but even that only made matters worse, for when he saw the beautiful bound volumes that Miss Holbrook had just left, he frowned, and told David that he guessed he did not need his gift at all, with all those other fine books. And David could not seem to make him understand that the one book from him was just exactly as dear as were the whole set of books that his Lady of the Roses brought.

Certainly it was not a satisfactory visit at all, and for the first time David was almost glad to have Mr. Jack go and leave him with his books. The books, David told himself, he could understand; Mr. Jack he could not—today.

Several times after this David's Lady of the Roses and Mr. Jack happened to call at the same hour; but never could David persuade these two friends of his to stay together. Always, if one came and the other was there, the other went away, in spite of David's protestations that two people did not tire him at all and his assertions that he often entertained as many as that at once. Tractable as they were in all other ways, anxious as they seemed to please him, on this one point they were obdurate: never would they stay together.

They were not angry with each other—David was sure of that, for they were always very especially polite, and rose, and stood, and bowed in a most delightful fashion. Still, he sometimes thought that they did not quite like each other, for always, after the one went away, the other, left behind, was silent and almost stern—if it was Mr. Jack; and flushed-faced and nervous—if it was Miss Holbrook. But why this was so David could not understand.

The span of handsome black horses came very frequently to the Holly farmhouse now, and as time passed they often bore away behind them a white-faced but happy-eyed boy on the seat beside Miss Holbrook.

"My, but I don't see how every one can be so good to me!" exclaimed the boy, one day, to his Lady of the Roses.

"Oh, that's easy, David," she smiled.

"The only trouble is to find out what you want—you ask for so little."

"But I don't need to ask—you do it all beforehand," asserted the boy; "you and Mr. Jack, and everybody."

"Really? That's good." For a brief moment Miss Holbrook hesitated; then, as if casually, she asked: "And he tells you stories, too, I suppose,—this Mr. Jack,—just as he used to, doesn't he?"

"Well, he never did tell me but one, you know, before; but he's told me more now, since I've been sick."

"Oh, yes, I remember, and that one was 'The Princess and the Pauper'; wasn't it? Well, has he told you any more—like—that?"

The boy shook his head with decision.

"No, he doesn't tell me any more like that, and—and I don't want him to, either."

Miss Holbrook laughed a little oddly. "Why, David, what is the matter with that?" she queried.

"The ending; it wasn't nice, you know."

"Oh, yes, I—I remember."

"I've asked him to change it," went on David, in a grieved voice. "I asked him just the other day, but he wouldn't."

"Perhaps he—he didn't want to." Miss Holbrook spoke very quickly, but so low that David barely heard the words.

"Didn't want to? Oh, yes, he did! He looked awful sober, and as if he really cared, you know. And he said he'd give all he had in the world if he really could change it, but he couldn't."

"Did he say—just that?" Miss Holbrook was leaning forward a little breathlessly now.

"Yes—just that; and that's the part I couldn't understand," commented David. "For I don't see why a story—just a story made up out of somebody's head—can't be changed any way you want it. And I told him so."

"Well, and what did he say to that?"

"He didn't say anything for a minute, and I had to ask him again. Then he sat up suddenly, just as if he'd been asleep, you know, and said, 'Eh, what, David?' And then I told him again what I'd said. This time he shook his head, and smiled that kind of a smile that isn't really a smile, you know, and said something about a real, true-to-life story's never having but one ending, and that was a logical ending. Lady of the Roses, what is a logical ending?"

The Lady of the Roses laughed unexpectedly. The two little red spots, that David always loved to see, flamed into her cheeks, and her eyes showed a sudden sparkle. When she answered, her words came disconnectedly, with little laughing breaths between.

"Well, David, I—I'm not sure I can—tell you. But perhaps I—can find out. This much, however, I am sure of: Mr. Jack's logical ending wouldn't be—mine!"

What she meant David did not know; nor would she tell him when he asked; but a few days later she sent for him, and very gladly David—able now to go where he pleased—obeyed the summons.

It was November, and the garden was bleak and cold; but in the library a bright fire danced on the hearth, and before this Miss Holbrook drew up two low chairs.

She looked particularly pretty, David thought. The rich red of her dress had apparently brought out an answering red in her cheeks. Her eyes were very bright and her lips smiled; yet she seemed oddly nervous and restless. She sewed a little, with a bit of yellow silk on white—but not for long. She knitted with two long ivory needles flashing

in and out of a silky mesh of blue—but this, too, she soon ceased doing. On a low stand at David's side she had placed books and pictures, and for a time she talked of those. Then very abruptly she asked:—

"David, when will you see—Mr. Jack again—do you suppose?"

"To-morrow. I'm going up to the House that Jack Built to tea, and I'm to stay all night. It's Halloween—that is, it isn't really Halloween, because it's too late. I lost that, being sick, you know. So we're going to pretend, and Mr. Jack is going to show me what it is like. That is what Mr. Jack and Jill always do; when something ails the real thing, they just pretend with the make-believe one. He's planned lots of things for Jill and me to do; with nuts and apples and candles, you know. It's to-morrow night; so I'll see him then."

"To-morrow? So—so soon?" faltered Miss Holbrook. And to David, gazing at her with wondering eyes, it seemed for a moment almost as if she were looking about for a place to which she might run and hide. Then determinedly, as if she were taking hold of something with both hands, she leaned forward, looked David squarely in the eyes, and began to talk hurriedly, yet very distinctly.

"David, listen. I've something I want you to say to Mr. Jack, and I want you to be sure and get it just right. It's about the—the story, 'The Princess and the Pauper,' you know. You can remember, I think, for you remembered that so well. Will you say it to him—what I'm going to tell you—just as I say it?"

"Why, of course I will!" David's promise was unhesitating, though his eyes were still puzzled.

"It's about the—the ending," stammered Miss Holbrook. "That is, it may—it may have something to do with the ending—perhaps," she finished lamely. And again David noticed that odd shifting of Miss Holbrook's gaze as if she were searching for some means of escape. Then, as before, he saw her chin lift determinedly, as she began to talk faster than ever.

"Now listen," she admonished him, earnestly.

And David listened.

CHAPTER XXIV

A STORY REMODELED

THE pretended Halloween was a great success. So very excited, indeed, did David become over the swinging apples and popping nuts that he quite forgot to tell Mr. Jack what the Lady of the Roses had said until Jill had gone up to bed and he himself was about to take from Mr. Jack's hand the little lighted lamp.

"Oh, Mr. Jack, I forgot," he cried then. "There was something I was going to tell you."

"Never mind to-night, David; it's so late. Suppose we leave it until to-morrow," suggested Mr. Jack, still with the lamp extended in his hand.

"But I promised the Lady of the Roses that I'd say it to-night," demurred the boy, in a troubled voice.

The man drew his lamp halfway back suddenly.

"The Lady of the Roses! Do you mean—she sent a message—to me?" he demanded.

"Yes; about the story, 'The Princess and the Pauper,' you know."

With an abrupt exclamation Mr. Jack set the lamp on the table and turned to a chair. He had apparently lost his haste to go to bed.

"See here, David, suppose you come and sit down, and tell me just what you're talking about. And first—just what does the Lady of the Roses know

about that—that 'Princess and the Pauper'?"

"Why, she knows it all, of course," returned the boy in surprise. "I told it to her."

"You—told—it—to her!" Mr. Jack relaxed in his chair. "David!"

"Yes. And she was just as interested as could be."

"I don't doubt it!" Mr. Jack's lips snapped together a little grimly.

"Only she didn't like the ending, either."

Mr. Jack sat up suddenly.

"She didn't like—David, are you sure? Did she say that?"

David frowned in thought.

"Well, I don't know as I can tell, exactly, but I'm sure she didn't like it, because just before she told me *what* to say to you, she said that—that what she was going to say would probably have something to do with the ending, anyway. Still—" David paused in yet deeper thought. "Come to think of it, there really isn't anything—not in what she said—that *changed* that ending, as I can see. They didn't get married and live happy ever after, anyhow."

"Yes, but what did she say?" asked Mr. Jack in a voice that was not quite steady. "Now, be careful, David, and tell it just as she said it."

"Oh, I will," nodded David. "She said to do that, too."

"Did she?" Mr. Jack leaned farther forward in his chair. "But tell me, how did she happen to—to say anything about it? Suppose you begin at the beginning—away back, David. I want to hear it all—all!"

David gave a contented sigh, and settled himself more comfortably.

"Well, to begin with, you see, I told her the story long ago, before I was sick, and she was ever so interested then, and asked lots of questions. Then the other day something came up—I've forgotten how—about the ending, and I told her how hard I'd tried to have you change it, but you wouldn't. And she spoke right up quick and said probably you didn't want to change it, anyhow. But of course I settled *that* question without any trouble," went on David confidently, "by just telling her, how you said you'd give anything in the world to change it."

"And you told her that—just that, David?" cried the man.

"Why, yes, I had to," answered David, in surprise, "else she wouldn't have known that you *did* want to change it. Don't you see?"

"Oh, yes! I—see—a good deal that I'm thinking you don't," muttered Mr. Jack, falling back in his chair.

"Well, then is when I told her about the logical ending—what you said, you know,—oh, yes! and that was when I found out she didn't like the ending, because she laughed such a funny little laugh and colored up, and said that she wasn't sure she could tell me what a logical ending was, but that she would try to find out, and that, anyhow, *your* ending wouldn't be hers—she was sure of that."

"David, did she say that—really?" Mr. Jack was on his feet now.

"She did; and then yesterday she asked me to come over, and she said some more things,—about the story, I mean,—but she didn't say another thing about the ending. She didn't ever say anything about that except that little bit I told you of a minute ago."

"Yes, yes, but what did she say?" demanded Mr. Jack, stopping short in his walk up and down the room.

"She said: 'You tell Mr. Jack that I know something about that story of his that perhaps he doesn't. In the first place, I know the Princess a lot better

A NEW OPPORTUNITY

for

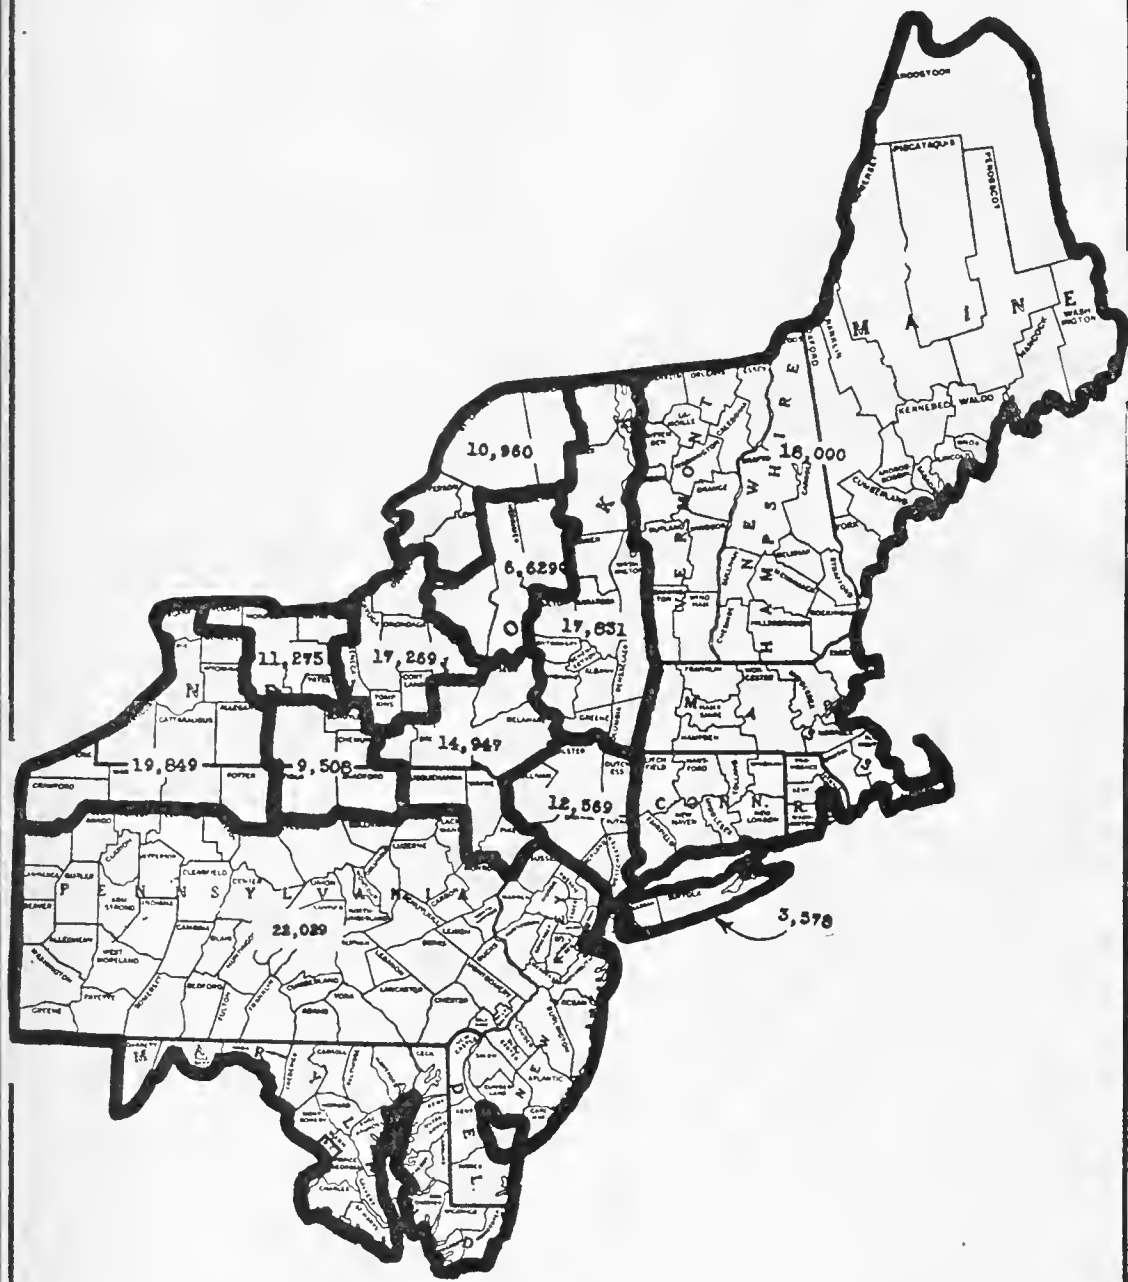

LOCAL ADVERTISERS!

AMERICAN AGRICULTURIST

Zone Plan

Offers

local advertising coverage thru 12 separate zone editions

American Agriculturist is now publishing editions for twelve separate zones as designated by the map above. Advertising space may be purchased at an attractive rate for one or more of these zones. This plan offers a new opportunity to merchants, manufacturers, and others whose trading area is confined to one or more zones and who could not use the entire circulation of American Agriculturist. American Agriculturist circulation reaches farm homes in the territory as designated once each week throughout the year, and because of its prestige as a farm magazine over a long period of years, is sure to gain for an advertiser an excellent acceptance for his goods or services.

ADVERTISING DEPARTMENT, 461 FOURTH AVE., N.Y.C.

Hungry Bears Cause Excitement

IT was a "bear" of an evening at the feeding grounds for bruin at the Canyon in Yellowstone National Park.

A "goodly crowd was there," a large group of farmers and their wives from one of the Northern Pacific Railway parties. Ten full grown grizzlies were counted, including a mother with three cubs and a mother with two.

Holding the center of attraction was the "king" of the herd, or flock, or whatever formation bears come in, if any. He was in a very advantageous position, atop the "dinner table." There were bears all around him, each one, apparently, anxious to get a morsel of food, but the "king" held the fort and would let none nearer than the outer edges of the food pile. Just a mean look and a snarl was enough for even the most ambitious bear.

Nevertheless, everything was going along serenely enough, when the mother with the three cubs came along. She was hungry. So were the cubs. The "old lady" would venture close to the pile of food, the "king" would growl, and the mother would back away.

Finally, with a determined "woof-woof," she raided the pantry, temporarily dethroning "King Bruin," and then divided the spoils with her family, going back for more provisions. However the "king" had gone back to the pile, in the meantime, and with the second approach of the mother bear, things began to happen. There was a brief but fierce fight in which Mother Bear was nicked a couple of times.

Losing all sense of direction, Mrs. Bear and the three bearlets started toward the crowd, but a ranger stopped her. Were the spectators excited? And how!

American Agriculturist will conduct an excursion on August 1st to Yellowstone Park from New York State. It will last eleven days. Not only will you be enabled to see the wonderful natural life and scenery of the Park, but all of the intervening farm country across the great West, with many stops and much sight-seeing from busses along the way while the train waits.

The price is much less than you could do it alone, because of the size of the party. The people are the finest ever being your own kind of farm folks; teachers and ministers, too, are cordially invited to attend. For full particulars, write, without obligation, to the Tour Editor, American Agriculturist, 461 Fourth Avenue, New York City.

Is the Federal Land Bank Fair?

I think it is about time that farmers were told the truth about the Federal Land Banks. So much has been said in favor of them that many farmers borrow heavily without investigating. In the first place, every borrower must take 10 per cent of his loan in stock which pays no interest or dividend. Therefore, he only gets 90 per cent of the face value of the mortgage. If the mortgage calls for 5 per cent interest he starts in paying a little over 5 1/2 per cent on the value received.

Last summer I put in over \$300. in improvements. Later I had some bad luck and although I was able to pay my interest on the Federal Land Bank loan, I was not able to make payment on the principal. Now I am threatened with immediate foreclosure. Is it any wonder that they are getting farms on their hands? How much better it would be to keep the owner on the place, than to foreclose on him and let the farm stand idle and the buildings rot.

WE have always had a feeling that the terms under which the Federal Land Bank loans money are much more favorable than those usually secured from a bank or private individual. In spite of the rather severe indictment by our subscriber, we still believe this. Feeling that there must be some misunderstanding, we sent a copy of our subscriber's letter direct to President E. H. Thomson of the Federal Land Bank at Springfield. Obviously, it would not be fair to print our subscriber's name, but we did give it to Mr. Thomson and he was able to refer to the case through the records in his office. Mr. Thomson writes:

"Your subscriber is very much mistaken

as to the operations of the Federal Land Bank. In the first place, he speaks of the stock which he takes out with the loan. This stock, equal to 5% of the amount of his loan, is in the local National Farm Loan Association, the membership of which is made up entirely of the borrowers within that given district. He holds no stock in this bank whatsoever. The National Farm Loan Association in turn holds a like amount of stock in the Federal Land Bank which stock, as well as that of all the other loans through that Association, is pledged as collateral for all the loans through that Association. All the earnings of this bank other than the amounts necessary for reserves go back to these National Farm Loan Associations and this bank has returned dividends in excess of \$500,000 to the National Farm Loan Associations. If the Associations deem it wise they may declare dividends to their respective borrowers. Owing to the very distressed condition of agriculture, especially in Central and Western New York, this bank has not paid any dividends to the Associations for the last few years.

"This particular borrower has a mortgage at 5 per cent on a twenty year plan. All he is required to pay is the interest on the mortgage plus \$175. on principal each year. A payment on his loan was due November 1. No letters have been written to him except the usual form notices, all of which were courteous and with no threats of any character.

"You are correct in your understanding that the Federal Land Bank does not wish to foreclose and never does foreclose on deserving farmers if any other way out is possible. Each case is thoroughly investigated and every possible help is given to the borrower to enable him to work out of his difficulty. Obviously, however, the bank cannot let these installments go unpaid as there is no provision in the set up of the system for such postponement. The bank borrows the funds from the investing public, in this instance at the ridiculously low rate of 4 per cent and loaned it to this borrower and others through the medium of the National Farm Loan Associations at 5 per cent and on a long term mortgage and interest, rate on which cannot be raised. Obviously, the farmer has every advantage in this form of a contract but it becomes our duty to carry out these loans in a firm and business-like manner."

The Man Who Worked in a Mill

IN Akron, Ohio, lived a man who we will call John Smith. Here is the story he told me:

"When I was married I came to this town and worked in the rubber shop. At first my wages were small, but in a little while I got an increase. I was young, enthusiastic and rather vain of my glossy black head of hair. I had good health and good teeth. I have worked now fifteen years in this same shop. My wages have been increased from time to time till now I am earning five dollars per day. But as the wages increased the expenses increased. Children came. We had some sickness.

At the first of the month the rent is due. After I pay my rent my pay envelope for that week is badly shot. The next week I must catch up on my grocery bills and running expenses. My pay envelope is shot the second week. The third week I pay something on doctor bills and my envelope is shot again. The fourth week the rent is due for the next month again.

After fifteen years of hard work and really good pay, I have nothing to show for it but a little bit of furniture in the house.

I have a bad case of catarrh, breathing the dust of the shop for fifteen years. I have lost my teeth. I am so bald that a barber could cut my hair with my hat on."

After listening to this story, I am inclined to think that the big future for the average young man is on the land.

—R. H. GWINNER.

Cedar rust on the apple cannot be controlled by spraying. The common pasture cedar is the alternate host of this disease. Their removal means control. How many are just over the fence? Cut your own and ask your neighbor to cooperate.

More About Gas Leases

SOME time ago several subscribers wrote asking us whether or not a gas or oil lease acted as a lien on property which would be likely to make it more difficult to obtain loans or mortgages on real estate. Knowing that the Federal Land Bank has loaned a lot of money on New York State farms, we took this question up with them. The following is a copy of their reply which explains very clearly the attitude of the Land Bank towards oil and gas leases:

"In handling these matters, it is the policy of the bank to judge each case on its merits and to be as liberal to the farmer as the facts justify. There are certain rights which the bank must insist on having. If a farmer applies to this bank for a loan and the examination of the title shows that there are outstanding oil and gas leases, we require an assignment of the borrower's interests in these leases to the bank at the time we take the mortgage on the farm. If the bank took the mortgage without this assignment and in after years the property had to be sold by foreclosing for some reason or other, the bank would have no title to these oil and gas leases and such a claim would be a hindrance to the sale of the property. However, by the borrower assigning his interests in these oil and gas leases to the bank at the time the loan is made does not mean that the bank necessarily will insist on receiving any income therefrom. As long as the farmer maintains his property in good condition, pays the installments on his mortgages and the taxes, the bank would be quite willing to allow him to receive all rents and royalties from the leases in question. Such oil and gas releases are no different from outstanding timber releases and all such must be assigned or cleared before the bank will take the mortgage.

Should Notify Bank

In the second place, where a loan has been made some years and the farmer signs an oil and gas lease without notifying the bank and thus without obtaining any release from the bank's mortgage he could, of course receive such rents and royalties. However, the oil and gas company will generally require that the farmer get a release of these rights from the bank's mortgage. Otherwise, in case of default and foreclosure the company's rights would be cut off unless they protected themselves as they stand in the nature of a second mortgage. In all such requests, before this release from the bank's mortgage is granted, the bank will require the farmer to sign the benefits of the lease to the bank as a matter of precaution and to insure that the bank's claim is a first lien in every respect should trouble arise in later years. The bank will not require the farmer to pay these rents and royalties in on the mortgage unless the bank's interests are jeopardized by mismanagement of the property or by default of the terms of the mortgage.

Each case is considered separately and treated according to its merits. If the farmer signs a gas and oil lease which the bank feels is not equitable, the bank may refuse to grant a release from its mortgage. This is the only method whereby the bank can insist upon the character of an agreement which in effect comes ahead of its mortgage when a release is granted.

In all matters of this character which involve rights of way, timber releases, oil and gas leases and so forth, it is the policy of the bank to judge each case individually and to make such decisions as the facts justify bearing in mind the equitable rights of all parties concerned."

Company Now Out of Business

WE have recently had two complaints against the Congress Shoe Company of Chicago, Illinois. Both subscribers claim that they did not re-

ceive shoes ordered from this company. We got in touch with them but were informed that the Congress Shoe Company is temporarily closed down. We were also informed that, they are attempting to make some connections in the East and that our letters to them would be taken care of when the company started up business again.

We are giving the facts to our subscribers for their information.

No Forwarding Address

After reading some of your answers to inquiries I am encouraged to write you regarding an ovenette which I ordered from an agent last October, paying 50c deposit. Upon receipt of the article I was to pay the balance. They wrote me that they had shipped the ovenette which was not received. I wrote them again and they claimed they had shipped another one. Since then, I have not heard from them.

When I wrote them on January 19, telling them what I thought of them, the letter was returned marked "removed, no forwarding address given."

WE investigated this company and find that they have moved and have left no forwarding address as our reader reported. While we are sorry

for our subscriber's loss, which in this case happened to be small, there is nothing that we can do about it, much as we would like to.

Protect Yourself

THE National Better Business Bureau states that more than five million dollars has been sunk in worthless oil stock by inexperienced investors. It is difficult to issue warnings about worthless stock because by the time an investigation is completed, investors have already sent a lot of money. It is possible, however, for every investor to protect himself. The National Better Business Bureau suggests that before investing money in a stock you should get satisfactory answers to the following questions about the company issuing the stock:

1. Who are the principals of the company, and what is their previous experience and past promotional records?
2. Where is the well located; in what geological formation and what is the acre spacing or drainage area?
3. How many wells are on the promoter's tract and on the surrounding acreage?
4. What is the estimated average recoverable production in barrels per acre of the geological formation?
5. What amount does the promoter propose to raise for his project and what percentage does he control or retain?
6. What is the actual interest in production made available to the public which capitalizes the drilling of the wells?

About Posting Farm Property

I am enclosing sketch and dimensions of my farm. Will twelve signs be enough to post it legally and does each trespass sign have to be on a post especially made for that purpose? Does the law require that the signs next to a highway be any certain distance from the center of the road regardless of how close to the road the fence may be?

If a man posts his farm and wants someone arrested for trespassing and the

Promptness Appreciated

I received your letter of sympathy and the North American Accident Insurance Company's draft for \$500. indemnity due on the policy held by Jennie L. Crump and I sincerely thank you for same.

I appreciate your promptness and will always speak a good word for the American Agriculturist.

Very truly yours,
EVAN D. CRUMP
Administrator of Jennie L. Crump Estate.
404 Temple Street
Dunkirk, New York

Mrs. Crump was struck by an automobile while crossing the street and died as a result of the accident.

local justice will not make out a warrant, what shall he do? I have been troubled for two years.

IT is always a good plan to put up "No Trespass" signs even in excess of the number required by the law, and we believe that to post one not less than 40 rods apart and on each corner, it would be safer for you to order two dozen.

There is nothing in the law which says that posters should be on posts especially made for that purpose. We think it wise to post them on a flat piece of board which can be nailed about breast high, or little higher, on trees or posts. We find nothing in the law requiring that they be in a certain distance from the center of the road. In case the road is a certain specified width, it would seem to us that they should be posted on the boundary of your farm. Some farm deeds state that the property goes to the center of the highway and in such a case, we think the signs should be posted at the fence or on a post outside of the road itself.

If someone trespasses on your land, which is properly posted, according to the law and you are unable to get a warrant for his arrest, write to us, giving the full details of the case and we will forward the information to the Conservation Department. In several cases recently where this has been done, the Conservation Department has turned over evidence to the Attorney General which has resulted in the prosecution and conviction of the trespasser.

Pop corn can be too dry as well as too wet. If it is too dry, hang it outside in a cloth bag. Try a little each day until every kernel pops, then seal it in glass jars, and it will keep in good popping condition for a long time.

To date 2,536 American Agriculturist subscribers have received indemnity from our insurance service.

G.L.F. Service

March 21, 1931

TO THE FARMERS OF THE NEW YORK MILK SHED:

You own the G.L.F. I am writing this letter to you as your employee. It will pay to keep this relationship in mind as you read it.

You naturally must buy your Spring plant food (fertilizer) requirements as cheaply as possible. You have two sources of supply available: (1) Your own organization, (2) Other fertilizer mixers. In comparing these two sources of supply, I feel that it is important you know certain facts.

G.L.F. FERTILIZER PRICES ROCK BOTTOM

Your G.L.F. fertilizer prices as quoted are as low as they can be made and break the Exchange even, yet they need to carry, to my certain knowledge, less provision for overhead and selling expense than the prices of any other company mixing fertilizer. They are what they are because your G.L.F. puts into a bag of mixed fertilizer, as shown by the public formula, those plant foods which are recommended by the College Fertilizer Conference Board. One of these specifications is that every ton of approved mixed fertilizer secure 20% of its nitrogen content from Nitrate of Soda. Eliminate this one provision and it would be possible to save as much as \$2.00 per ton on the cost of certain mixtures, yet Nitrate of Soda is put in the mixture because disinterested authorities believe it is worth the extra cost.

This is a single example of why a fertilizer which is mixed according to the recommendations of the College Fertilizer Conference Board, may cost more because it is worth more. It can be multiplied several times in the make-up of your G.L.F. approved formula mixed fertilizers.

OTHER PRICES HAVE NO BOTTOM

When it comes to prices on fertilizers which are mixed according to secret formulas, there is no bottom. This is demonstrated every Spring. At certain prices, these secret formula fertilizers, because there is a limit to which they can be cheapened, become a good buy, but as farmers you are foolish if you pay within several dollars per ton for them of what you have to pay for approved public formula fertilizers. As a matter of fact, you don't need to.

If you personally think it's your best long time policy to buy them, don't be in a hurry to deal. Don't bid for them more than they are worth. Eventually you will get them for your own price, or you can always get sound value through your own organization.

Respectfully yours,

H. E. Babcock.
General Manager

P.S. Ask your G.L.F. Agent-buyer about AMMONIATED SUPER-PHOSPHATE, a new fertilizer service so far available only through the G.L.F.

MOST likely if I were wise I would never again try the patience of the readers of the A. A. by trying to tell another story concerning Long Island, because, if my memory is correct, I have been writing impressions of this

Jared Van Wagenen, Jr.

Sunrise Country almost every year for a half dozen years past. On the other hand, the typical Long Islander is so proud of his land and so whole-hearted in his hospitality and can always think of something that you did not see the last time that I always find it hard

to get on and off the Island without afterwards bursting into print.

Now when (as happened last week) three men insist upon making you their guest and then leave their usual tasks and give up the day to driving you about the country and showing you the sights, about the only

returns you can possibly make is to tell a little story concerning what you see and thus pass it on to others. As a matter of fact, I have just been made the beneficiary of such hospitality and courtesy as cannot be purchased with money and so I here publicly acknowledge a debt, which I cannot discharge due to my three good friends of the South Shore.

I suppose the best known product of Long Island is commuters—people who use New York City as their work shop but who use Brooklyn and much of the Island for fifty miles east as their bed-room. Getting this multitude to and from their jobs each morning and evening calls for a transportation system—railroads, ferries, bridges, and tunnels—which is one of the wonders of the world.

The products of agricultural significance include potatoes and cabbage, Brussels sprouts and cauliflower, flowers and vegetables grown under glass, Long Island ducklings and old burial grounds. I do not know that these last can be classed as an agricultural product or that they have any particular connection with the other items, but at

any rate, they reach their finest development in ancient country communities and I do claim to be something of a specialist in poking around in decaying church-yards.

Long Island does a great deal of farming under glass and my friends took me to see an establishment that was growing roses and nothing else. There was one house 80x6000 feet. Just compare those dimensions with the biggest barn you ever saw. There was another house 80x400 and several smaller ones. In all there were three and one-half acres under glass and the whole area was devoted to roses—all except a few benches of gardenias and asparagus fern. If they had told me that this was the biggest rose house in the country I would have believed them. As a matter of fact, the owner was a very honest man who said that he knew of several that were larger—some of them two or three times as large. Now I do not propose to try to discuss rose varieties or the technique of growing them under glass. If I were to do so my observations would probably be most remarkable for the number of things that were not correct. I may say, however, that this

PROFIT

FARM PROFIT is not always dependent upon high prices. Many farmers make money *even when prices are low*. They do it by keeping their *production costs down*. Many of them hold costs down by increasing the *yield per acre* with Armour Fertilizers. With the help of Armour Fertilizers they produce *more* without increasing labor costs or acreage.

There's an Armour Fertilizer for any crop you grow — corn, potatoes, tobacco, fruit, truck, canning. There's an Armour Fertilizer suited to the soil requirements of any farm, whether lowland or upland, heavy or light.

See your Armour dealer — today. Have him supply you the grade of Armour Fertilizer you need to increase your yield and reduce your cost to grow.

Armour Fertilizer Works

General Offices

111 West Jackson Boulevard

Chicago, U. S. A.

OATS

SENSATION—One of the most productive oats in cultivation, 75 bu. and upward per acre are frequent, with large, white, meaty grains weighing 44-46 lbs. per measured bushel, of the highest quality. We are making an exceptionally low price in quantities. You should by all means try these oats. Also Early Clarence and White Cap Seed Corn, Bearded and Smooth Barley, Soy Beans and Sweet Clover. Write us for samples and prices.

THEO. BURT & SONS Box 85 Metros, Ohio

FARMEX FACTS

Ever since the invention of plows, man has laboriously grubbed around stones in his fields. With the coming of tractors and larger horse-drawn machinery, methods were developed to remove these stones. Snake Hole blasting is a simple and most effective way of getting rid of boulders. It not only cracks the stone but throws it out of the ground as well.

FARMEX EXPLOSIVES

In these times when the farmer is seeking lower production costs—it is obvious that straight furrows and straight rows constitute a permanent form of farm relief which the individual himself can achieve with the judicious use of explosives. It is the quickest, most economical, most business-like way of solving the boulder problem! Write for particulars regarding the use of Farmex for such work.

ATLAS POWDER COMPANY
Wilmington Delaware

Free Power for Pumping

A stream, spring or artesian well will operate a Rife Ram and pump water for house, barn, garden, swimming pool or fountain. No fuel, oil or electric current needed. Can use air pressure or open tank. Our rams are hot-galvanized, guaranteed rust-proof. Write for full information. Rife Hydraulic Mfg. Co., 90-G West St., New York City.

You Can't Blame Us For Printing This

Mr. B. F. Arthur, owner of the Linden Orchards, Winchester, Virginia, wrote the following letter which every farmer and fruit grower should read:

The Cutaway Harrow Co., Higganum, Conn.
Dear Sirs: We started our Orchard Flexible Double Action Tractor Harrow and we are certainly delighted with the work it does. It is the only disk that ever ran in our orchards that did not require weighting down with sand bags or stone weights, and we find the flexible feature most excellent for ringing and cutting around the trees in a continuous circle. There is no dragging effect as in rigid machines and a Fordson Tractor walks off with it up steep hills. It has so far run over rocks, breaks and loosens stones WITHOUT EVEN CHIPPING A SINGLE DISK. It gives us pleasure to let you know the satisfaction this "Cutaway Harrow" is giving us.

Here's what he wrote about

Clark Flexible Double Action Harrow

combines the utmost in flexibility with the utmost in efficiency. Like all Clark "Cutaway" tillage implements, it does the greatest amount of work in the shortest time.

Light draft. The front section can be used separately if desired as rear section is detachable. The disks are made of cutlery steel—heat treated and forged sharp. Forged edge disks, found only on Clark "Cutaways" won't crack or break even when used on stony ground. They outlast 2 to 3 sets of other disks. Unconditionally guaranteed for 3 years. Choice of cutout or solid disks same price. Clip coupon for FREE catalog which tells more about the Clark "Cutaway" Flexible Double Action Harrow; also about double action rigid frame harrows and other tillage implements. Valuable book, "The Soil and Its Tillage" also sent FREE.

The Cutaway Harrow Company,
78 Main Street, Higganum, Conn.
Please send me FREE catalog, prices and book, "The Soil and Its Tillage."

Long Island—The Sunrise Country

(Continued from Page 1)

establishment burns 2000 tons of coal per year and employs an average of 35 men. That is a labor force of ten men per acre. Well, the ordinary general purpose upstate farm will, including the owner, use hardly more than one man per hundred acres so I conclude that farming under glass is say on thousand times as intensive as so called general farming. How is my reader impressed by these figures? Of course, if devoted to lettuce or strawberries, an outdoor farm may make some remote approach to this hot-house agriculture.

I did not feel at liberty to make inquiries as to gross returns per acre of glass but it goes without saying that they must be something rather tremendous.

I know of nothing that better symbolizes luxury and wealth than cut flowers in mid winter. The owner did tell me that he had known selected long-stemmed roses to sell for as much as \$50.00 per dozen. He also mentioned the fact that during recent weeks when some men have gone hungry, a New York man made a "coming out party" for his daughter. The bill for flowers was \$5000.00 this, of course, only one of many items that go with getting your daughter properly introduced into her world. I suppose there is a stratum of society where expenditures such as this are regarded as neither unusual nor improper. Well, a day or two ago I frankly stood as a sightseer to watch the bread line that just now daily winds its unwieldy length in front of the Pennsylvania Station in New York and saw a compact column of men six or eight abreast and three blocks long waiting for a nine o'clock distribution of breakfast by one of the Catholic churches in that vicinity and I concluded that when the wild-eyed Socialist or Red orator mounts his soap box to denounce the injustice of society he will have a pretty good text provided for him. It is such cynical flaunting of ostentatious luxury and lavish expenditure in the face of poverty and human misery that makes Bolsheviki and gives the radicals something to talk about. I think this is about the first time that I have ever tried to inject any economic theories into the columns of the A. A. If I seem to be just a bit sour or ill natured about it, please forgive me.

Well, in any case the subject of ducks is very much less aesthetic than roses, and a duck ranch was our next objective.

Now I am not starting to write an article on how to grow Long Island ducklings. If a man were to attempt this he ought to spend a year or two in working at the business and gathering information and then not half would be told. I had known in a general way that this was a big business and from the train or from a speeding automobile I had seen acres of ground literally crowded with thousands of snow white birds but not until the other day did I have the opportunity of visiting a duck ranch and of talking at length with Mr. Joseph A. Titmus, President of the Long Island Duck Growers' Association—a man who is recognized as one of the largest and most successful growers on the Island. So in very brief and casual fashion I would like to set down some of the facts given me and some of the impressions I received.

The foundation of this really great industry is based on the fact that there are a great many people who are willing and able to pay for the best food that the world offers and who have learned to regard Long Island Duckling as about the last word in gastronomic luxury. So it is that they are served in well provided homes and that they are found on the menu card of all high class restaurants in the larger cities. So, too, dining cars frequently feature them as "Special" and the big ocean liners habitually sail on their six day voyage with several hundred of these juicy birds in their larders.

Rather accurate figures are available concerning the size of the business on the Island. By far the larger part-

more than 70%—of the total output is marketed through one sales organization known as the Long Island Duck Growers' Association, and last year they accounted for three million, seven hundred thousand birds. Add to this the product of the non-cooperating growers and the Island puts out surely five million ducks annually. Bear in mind that here, as every where else, a "million" is a term very much easier to pronounce than it is to visualize or comprehend.

How They Are Advertised

From what I can learn this Duck Growers' Association is a rather tremendous marketing organization. It spends money freely for advertising purposes and it guarantees the standard quality of their sales. Every duckling goes to market wearing a tag giving his market grade. Their selling end is represented by the F. C. H. (Farmers' Commission House) who sell the entire product of their membership. No outside ducks are handled either from off the Island or from growers not members of this Association. All in all, it is an organization that ought to warm the cockles of the heart of a real honest-to-goodness cooperator.

Of course, Long Island is by no means the only place that grows duckling. New Jersey and Massachusetts and some other localities raise them in considerable numbers but after all the Island ducks have a sort of trade mark reputation all their own. I presume that these Island experts do, on the whole, make a higher class product. At any rate, it is the Long Island bird that tops the market and no matter where a duck grow up, on the menu card of the expensive restaurant he makes his first and last appearance in high society as "Long Island Duckling." One remarkable feature of the business is that it is concentrated in a very small area. Practically all the large growers are to be found within a fifteen mile radius comprising a little stretch of the South Shore and running far enough into the Island to include Riverhead and vicinity.

A Specialized Business

There is one respect in which duck ranching is very different from other forms of poultry keeping. Hens may be kept in great numbers but they may also be carried in small flocks along with general farming and, as a matter of fact, they tell us that our innumerable small farm flocks are the factor in the egg industry compared with which the big, commercial establishments are relatively unimportant. But they tell me that as a whole the duck business is in the hands of specialists who operate what we must regard as very extensive plants. Proof of this lies in the fact that the one hundred and four members of the Cooperative Association have an average capital investment of \$47,000—an amount of money the very thought of which would scare any dairyman or upstate farmer. The largest grower on the Island is credited with a production of two hundred thousand ducklings annually with a gross value of not less than a third of a million dollars. This begins to sound like "big business" on the land.

Now for just a few figures on costs. Where everything is conveniently arranged it is expected that one man will be able to care for about ten thousand ducklings. The ranch which I looked over most carefully has more than a half a mile of miniature railroad track to assist in the distribution of the many tons of feed required each day. Under these conditions the mere labor cost of growing a duckling will range from twelve to sixteen cents. Bear in mind that this is labor only—it does not include feed or over head or superintendence. Ducks are plucked by the piece and the usual rate paid is seven cents per bird. The pickers are women and a skilled operator has an earning power seldom surpassed among manual workers. Some women have picked as many as 120 ducks in a day. Seven ducks furnish a pound of feathers

(Continued on Page 14)

Depreciation Versus Oats

Horses Eat When Idle But Tractors Should Be Busy Too

NOT so long ago it was rather common to hear people say that a man must have a farm of such and such a size before he could use a tractor profitably. Perhaps the figure was 160 acres, 200 acres, or something else, but at any rate, the measuring stick was acreage. Now that tractors have been adapted to so many different uses, the size of the farm is no longer a reliable indication as to whether or not a tractor can be used economically. Sometimes the operator of a small farm can keep a tractor busier and make it more profitable than his neighbor on a larger farm. Of much greater importance than acreage is the number of hours a tractor can be used per year.

What Is "Overhead"

Records on farm tractors have shown beyond question that operating costs are decreased as the hours of use per year increase. A tractor employed 600 hours each year has only half the overhead charge per hour of operation that a similar tractor has which is used only 300 hours.

Under the general heading of "overhead" come such items as interest, depreciation and repairs. On an average sized tractor, a charge of \$180 per year for overhead is reasonable but the actual figure, of course, will vary. If the overhead is estimated at \$180 (say \$100 depreciation! \$50 interest and \$30 for repairs and overhauling) and the tractor used 300 hours per year, the overhead cost per hour will be 60 cents. If it is used 600 hours, this charge per hour will be cut in half to 30 cents. If it is used still more hours, the charge per hour will be still smaller. This overhead charge does not include fuel costs, of

By BERT GITTINS

course. Costs per hour for fuel and oil are not decreased by added usage.

One of the state agricultural colleges supervised cost records on a group of farms recently over a period of three years. It was found on these farms that tractors used over 300 hours per year generally cost less than \$1.00 an hour, figuring both overhead and fuel. Sometimes this cost went down to 50 cents an hour or lower if the tractor was used enough. Tractors employed less than 300 hours per year, on the other hand, had a tendency to cost over \$1.00 per hour. These records were kept on tractors which are not as economical to operate as those being manufactured at the present time, but they indicate the importance of keeping any tractor busy.

The cost of fuel, lubricating oil and grease on a three-plow tractor, which is about average in size, is not likely to run over 50 cents an hour. On small tractors which cover less ground it may go down around 35 or 40 cents an hour. By combining overhead and operating expenses, a fairly close estimate can be made of total tractor costs under varying conditions. For example, if the overhead on a three-plow tractor is 35 cents an hour and fuel costs are 50 cents, total

costs would be 85 cents an hour. As the overhead goes up or down the total cost also varies. Although many tractors are used only 200 or 250 hours a year, a figure of 600 or 800 hours is not unreasonable. On one of the college experimental farms last year, a tractor was used 841 hours for field work alone. In some areas where night work is common with tractors, these machines are used as much as 2,000 hours per year.

While the number of acres in a farm undoubtedly has an influence on the amount of usage which can be given a tractor, that is only one of the points to be considered. A live stock or dairy farm may be small from the standpoint of acreage but it may provide a great deal of belt work for the tractor, such as feed grinding, silo filling, corn shelling or hay baling. Tractor owners on many small farms do such work as custom plowing or belt work for (Continued on Page 12)

One way of making a tractor work harder. Concrete blocks wired to the harrows make them cut deeper.

Some Poultry Terms Made Clear

Definitions That Will Help You When You Buy Baby Chicks

By L. E. WEAVER
A. A. Poultry Editor

TO the average person the terms "certified," "accredited," and "R.O.P." mean in an indefinite sort of way that chicks or stock so designated are above the usual run in quality and also in price. But just what the difference is is not clear, although it is not a difficult matter to understand and indeed could very easily become of considerable importance when one is considering the purchase of chicks, pullets or males. I am, therefore, going to try to make plain what

these terms mean without going into too much detail.

Those who are familiar with the dairy business will get a fairly accurate idea of the differences from the statement that in a general way "certified" poultry parallels "registered" cattle; "R.O.P." (record of performance) poultry parallels "advanced registry" or "registry of merit"

in cattle; and "accredited" poultry is similar to "tuberculin tested" or "abortion tested" cattle. The disease, however, is different.

In poultry, it is bacillary white diarrhea—often called "B.W.D.," and correctly called "pullorum disease." In other words, a flock is accredited when it has been found free of pullorum disease after two or more tests of every individual taken six months or more apart. Pullorum disease (white diarrhea) is the worst disease that afflicts chicks. We know it can be, and very often is, passed on to the chicks by hens who are apparently normal and healthy but are actually carriers. Many

poultrymen have found that the "accrediting" of their flocks has materially reduced their chick losses, and it goes without saying that chicks from such flocks can at least start off free of the trouble. "Accrediting" then has nothing to do with the breeding or egg producing qualities of the birds. It is entirely a matter of being free from pullorum disease. However, accrediting costs considerable in both time and money, so no one ever bothers with it except with high-grade stock. Accredited stock is also sometimes called "blood-tested."

How It All Started

To get a better idea of "certification" let us go back twelve or fourteen years. It was about that time that it was found possible to pick out the high layers from the low-producers or culls in the fall of the year by the way they molt, by color changes in shanks, etc., by body type, head type, and by other indications. Men who were trained in this work at the experiment stations went about the country giving culling demonstrations and attempting to teach the poultrymen to cull their own flocks. To a large degree, they succeeded and a great deal of good undoubtedly has been done in this way. Here at last was a means by which the outstanding layers of a flock could be selected without the labor-consuming and expensive trap-nest. Soon a number of the larger breeders in the various states were asking that the trained men from the Experiment Stations come to their farms, not so much to cull out the poor birds as to select the high-producers to go into the breeding pen.

Skiping now over a lot of developmental history we can say that out of this beginning

(Continued on Page 9)

These chicks will be valuable to their owner in proportion to their health and ability to produce heavily.

Vol. 127 March 28, 1931 No. 13

Thought for the Week

A SHORT time ago we mentioned here the hundreds of unfortunate members of the A. A. family who have been confined to the house, by illness or by accident, for months or even years. Unless one has gone through such an experience he can never realize how slowly time can drag and how little there is to take up one's mind, so we made the suggestion that we would be glad to print the names and addresses of shut-ins to whom other members of the A. A. family could write.

We have already had some response and are printing below the names of five. Drop them a line. Do not add to their troubles by expecting an answer. Send in the names of other shut-ins that you know but make sure first that they would like to have their name published.

Mrs. Helen E. Ormsby, Corinth, N. Y.

Mrs. Irving Bates, R. F. D., Cooperstown, New York.

Mrs. Edward Ottaway, R. F. D., Cooperstown, New York.

Mrs. Margaret Curtis, Corinth, N. Y.

Mr. Walter A. Miller, Box 324, Corinth, N. Y.

TB Indemnities Should Not Be Reduced

ONE of the most unwise bills introduced in the New York State Legislature in the present session, is Senate No. 1601, to amend the Agriculture and Markets law to reduce the indemnities paid to dairymen for animals condemned with TB. For years AMERICAN AGRICULTURIST in cooperation with the farm organizations, and with many of the farm leaders in the Legislature itself, worked to secure adequate and fair indemnities for dairy cattle. After years of such work, the indemnities were advanced only a short time ago to somewhere near what the cattle are actually worth. Such an advance was not made by the State until years after the prices of cattle had advanced, so that when cows were killed for TB the dairymen did not receive their replacement value; they lost out on milk production until cows could be replaced, and in general, there was much criticism and hard feeling over the TB eradication campaign.

The argument is now made that the indemnities should be reduced because the price of cattle is coming down and that appropriations could then go farther toward eradicating TB more generally. No one objects to a proper appraising of the value of cattle, by the Department of Agriculture and Markets appraisers in accordance

with the present lower prices of dairy cattle. We do object most emphatically, however, to the arbitrary reduction by law of indemnities particularly at this time. Fair, full value indemnities were a long time in being obtained. Let us not be too much in haste in arbitrarily reducing them.

Probably by the time you read this, this bill will have been defeated in the Legislature. It certainly should be.

Would Give Great Tract of Land to New Jersey Station

ANYTHING that tends to build up and increase the usefulness of a great institution like the New Jersey Agricultural Experiment Station is, of course, of vital interest to farmers. We hope, therefore, that nothing will interfere with the acceptance on the part of the New Jersey Legislature of the generous offer of James Turner of Montclair to give his 1100 acre Sussex County estate to the New Jersey Agricultural Experiment Station. The gift is made with the suggestion that it be used to establish a dairy cattle research institute.

Dr. J. G. Lippman, the capable director of the Station is enthusiastic over this gift and what it will mean to the dairy interests of the State if it is accepted. Details of the offer and Dr. Lippman's plans for using it are given in our New Jersey edition on the New Jersey news page.

Department of Justice After New Jersey Milk Situation

OUR New Jersey editor, Mr. Kirby, reports in the New Jersey edition this time, the beginning of an investigation on the part of the Federal Department of Justice, of the milk market situation in New Jersey. In particular, the Department of Justice wants to know why the spread between what the farmer receives and the consumer pays is so great. We want to know the same thing and we hope that the Department is successful in finding reasons for this spread.

The Department of Justice is also interested as to why, when milk prices are lowered, the farmer takes all of the reduction and the milk companies little or none. As a publication interested in the welfare of farmers, AMERICAN AGRICULTURIST would like to know the answer to this question also. It is about time that the milk dealer realized his share of the responsibility in maintaining an adequate supply of high quality milk for the metropolitan district.

To Tighten Trespass Law

FOR many years AMERICAN AGRICULTURIST has been interested in securing some kind of a solution or partial solution to the growing problem of trespassing upon farm lands. We will not take the time now to point out how acute this problem has become. Sufficient to say that with the increasing number of people coming from the cities, and the growing disregard for farmers' rights, many farmers, particularly those who live near the cities, have been irritated to the point of desperation. Under the present posting law, only hunters and fishermen are excluded. Many times, probably in the majority of cases, it is not the hunters and fishermen that cause the most trouble. We believe the majority of these sportsmen want to do the right thing. Their organizations are encouraging members to get permission when trespassing on property and to go out of their way to show respect for the farmers' property rights.

But there is no practical way of controlling the irresponsible trespasser who does not carry rod or gun. Therefore, AMERICAN AGRICULTURIST has advocated in Albany this year, the passage of a bill which would make it possible to post against not only hunters and sportsmen as at present, but more especially, to exclude all kinds of trespassers. Such a bill has been introduced by Mr. Bentley, chairman of the Assembly Commit-

tee of Conservation. It is the present posting law with the additional words in the bill "or to enter thereupon," which would exclude everybody.

The bill has been reported favorably in the Assembly and has some chance of passing. It has the backing of the Conservation Department and of the Advisory Council of the Department, with the approval of the officers of many of the conservation and sportsmen associations.

The thought back of it is not to exclude a person who has the courtesy to ask permission of farmers, or who has due regard for the farmers' rights. But if this bill passes, it puts the burden of proof upon the trespasser and not on the farmer, and if such a trespasser is caught upon posted land, he is guilty of a misdemeanor and is liable to a penalty of from \$10 to \$50, providing the farmer wants to take action. The bill would correct the injustice which now exists, which excludes hunters and fishermen, and does not keep out the "riff-raff" who, as stated above, cause much of the trouble.

Time to Nominate Master Farmers

THE Master Farmer judges are now ready to receive nominations for Master Farmers, Class of 1931. If you want to have the honor of nominating some friend or neighbor, here is your opportunity. We ask you, however, to be exceedingly careful in your judgment and choice. The qualifications laid down by the judges are very difficult to meet. When one knows that from the thousands of successful farmers in New York State, only eight or ten will be chosen, he realizes how strict the qualifications must be.

These requirements are becoming pretty well known. The man, first, must be an outstanding farmer. If he and his wife started without any money, so much the better. He must, in general, use scientific practices, run his farm on a business-like basis, and as proof of his success must have acquired some money from farming.

But these material qualifications are not enough. A Master Farmer is a real homemaker. He and his wife must have properly educated their children, and must have built up that atmosphere in their dwelling that makes the difference between a house and a home.

But even these qualifications are not sufficient. A Master Farmer is a good citizen. He is active in his church, school, and community. He is a man that you are proud to call friend, and the kind that you like to have at your shoulder when you are in trouble.

If you know one who meets all these requirements, send in his name. He will then be sent a detailed questionnaire, and may, if his qualifications seem to justify it, receive a personal visit sometime during the summer from a representative of the Board of Judges. Nominations this year must be received before May first.

This year of 1931 will be the fourth year that American Agriculturist has named Master Farmers in New York State. Nearly everyone has come to realize the ideals back of this movement. That is, not only to honor outstanding achievement in individual farmers and their wives, but more than this, to honor all agriculture and to emphasize the fact that farming, under the right circumstances, and by the right individual, is one of the finest occupations of man.

Eastman's Chestnut

COMMISSIONER Frank P. Graves, of the New York State Education Department, has considerable reputation as a story teller and always has an interesting bunch of Chestnuts at ready command. Once in a while he gets kind of tired with these worm-eaten ones that I tell, and sends me a batch of new and better ones. Here is one of his latest:

"The last time I was here you were running a fish market, but now you have got a cheese shop" said Jones to his friend. "Yes," said the friend, "you see the doctor said I needed a change of air."

A Century of Potato Marketing

A Look Backward May Help Us See What Is Ahead

By DANIEL DEAN

Tioga County, New York, Potato Grower

ONE hundred and thirty-seven years ago my great-great-grandfather, Captain John Smith, emigrated from New Jersey to what was then called "Out West" in the forests of Southern New York. Only fourteen years before, the power of the great Indian confederacy of the Six Nations had been broken by General Sullivan's expedition. Till then the Indians had been able to forbid white settlement in New York State excepting along the Hudson and Mohawk rivers. Settlers now came in fast, so fast that in 1830 the census showed Tioga County to have a larger population than ever before or since. For it was not till the Erie Canal was opened in 1825 that the surplus population along the seaboard could easily reach the fertile prairies of the Corn Belt States.

The frontier settlers of that day were forced to be self sufficient. Until the Canal was opened, manufactured goods could only be brought in by hauling over wretched roads from the Hudson or Delaware valleys or by laboriously pushing flat-boats up the Susquehanna with poles. The first potatoes in Tioga County were carried here from the Delaware Valley on a man's back. After the potatoes were eaten the parings were planted, and in the rich virgin soil gave a good yield.

Self Sufficient Communities

Each community had to produce its own food, including maple-sugar and the wool, flax, and leather it used. The local tannery tanned hides and the local cobbler would board with each family till every member had a new pair of shoes.

The nearest small cities were from 150 to 200 miles away through the forests. In these days of railroads and steamships, of a nation-wide network of concrete and macadam highways, and of airplanes flying overhead it is hard for us even to imagine what rural life must have been in the pioneer days. Canal transportation did not come till after 1820 and the Erie Railroad crossed the state between 1848 and 1853.

Any surplus product of the farm that could not be bartered for something else with a neighbor or at the little country village could only be wasted. Why should any farmer produce a thousand bushels of potatoes, a thousand bushels of peaches, or a thousand dozen of eggs when they could only rot for lack of a market, and when he needed every minute to produce the hundreds of things his family would need through the year?

The coming of the canals and then of the railroads changed everything. The pioneer community had been forced to produce most of what it consumed, and could sell almost nothing. Now the farm of 1931 works on the same business principles as the city factory of 1931. Each buys almost everything it uses and pays for what it buys by making and selling large quantities of a very few products. The owner of the factory and the owner of the farm must each study his markets and the possibilities of cheap production and efficient transportation to market. With the farm, the choice of products is limited by conditions of soil, climate and location with respect to possible markets.

This transition in farming has taken over a century and is still going on fast. Like the family doctor and the grocer the farmer is often slow to change from tried and proved methods to newer ones that promise more, but lack the guarantee of proved success in use.

In 1860 only fourteen per cent of the nation's population lived in cities against the seventy-five per cent or more of the present. The Civil War gave an immense push to the expansion of farm production. With over a million men in the ranks from the North alone, the new labor-saving

tools, grain-drill, reaper, mower, and threshing-machine came rapidly into use. Every increase in farm production released more and more men to work in the fast-growing city factories.

Between the Civil War and the Great War a great potato industry grew up in New York State. The surplus products of earlier days, wheat, cattle, sheep, etc. were no longer profitable because of the low priced com-

many potato planters, sprayers and diggers were used before as late as 1900. Grading was a hand job. The quick and nervous, trotting stock horses of those days did not mind working on side hills so steep that a mis-step might mean a roll to the bottom. Before bordeaux spraying came into use to control late blight and rot, the hill fields had another real advantage over lower lands.

This three row planter would be out of place on many hilly fields where potatoes are still grown by hand methods. A three row planter, by the way, is stiff competition for the man with a hoe.

petition from the newer lands of the Middle West. The present great dairy industry was then represented by the manufacture of butter and cheese. Fast growing cities within a distance of 300 miles demanded great quantities of potatoes, a bulky product so low in price that freight rates gave an advantage to nearby producers.

The often steep and stony hill farms of up-state New York were then far more fertile than now. The fact that these lands forced the use of hand labor in production was no handicap when New York's competitors also used hand labor. Tractors and trucks were but little used till after 1917. Not

The coming of the late blight and rot disease to the United States and to Europe about 1840 had an immense influence upon the potato industry. Before that time many of the potato varieties in use had been of poor quality, fit only for stock feed, and, in fact, were commonly known as hog potatoes. Blight and rot losses were immense for years and greatly reduced production, only 6,447,394 bushels being grown in 1860 against 30,123,614 bushels in 1840 before the blight came.

As all other means of control failed, many turned to the idea of breeding new varieties that should be resistant to blight and rot. The Reverend Chaun-

cey Goodrich of Utica imported many new varieties from South America, and from these many of our best present varieties are descended. The Garnet Chili, Early Rose, Beauty of Hebron, Burbank and other varieties spread rapidly all over the United States. Many were of superior table quality, and to them is due much of the popularity of the potato in the diet of the nation to-day.

All these conditions favored potato production on the hill farms of the state. Four hundred forty-one thousand acres were grown in 1907, nearly one-seventh of the nation's production. Only 265,000 acres were grown in 1930. The record production for a single state was made by New York in 1914 when killing frosts came late in fall and 53,215,000 bushels were grown.

How Conditions Have Changed

For nearly fifty years before the Great War the potato industry of New York State appeared to rest upon a secure basis. New York was always either first in production or very close to the top. All over the state hundreds of potato dealers handled the immense business of shipping the crop to cities. Many shippers had high reputations for reliability and quality of grading on the markets of New York and in Pennsylvania cities. Though the dairy industry was already cutting into potato production in Tioga County when I began growing potatoes in 1905 there were 180 carloads of potatoes shipped from Nichols that season. As late as 1917 very few Maine carloads crossed the Hudson River, and competition from Idaho was as yet far in the future.

Since that record crop in 1914 many conditions have worked heavily against the potato industry in up-state New York, particularly on the steep and stony hill lands. The invention and use of all kinds of potato machinery has increased by leaps and bounds in recent years, stimulated by the high wages for labor that came with the War. Not only wages but taxes have come up fast. Our principal competitors, Maine, Michigan, Wisconsin, Minnesota and Idaho are all using the new labor saving tools to the limit. With the cost of other competing farm products such as wheat also cut down by improved machinery, the potato grower on steep and stony soils is working under a heavy handicap. If he cannot use the improved potato machinery, his product will not pay going wages for labor at present prices for potatoes, and if he does not hire labor his own work will be poorly paid.

Potatoes Now Grown on Level Ground

The net result of these changes since 1914 is a great shift in the location of the potato industry within the state. The level and sandy soils of Long Island grew nearly 9,000,000 bushels in 1930. All over the up-state sections farmers with land not too steep and too stony are turning to potato production by the use of the large scale methods developed by competing states like Maine. Potato production is fast leaving the rougher and more stony soils. Old timers tell how Washington County potatoes were famous for their quality in New York City for many years. Often a Washington County farmer would rent a canal boat just as the season of canal navigation closed and float with his potatoes to New York, there to sell them out through the winter. Now that traffic in only a memory. Market milk has very largely replaced potatoes through the New York City milk shed. One New York State railroad with over 500 miles of track has only originated one car of potatoes in three years, though it brings in many from other states to its stations.

The spread of concrete and macadam

(Continued on Page 7)

The Song of the Lazy Farmer

MY NEIGHBOR said: "I hate to think how fire would put us on the blink, a cow might kick the lantern o'er, or else a match dropped on the floor might start a fire most any day and our whole place would blaze away. It certainly ain't any joke to see a barn go up in smoke, or else to git up out of bed and find the roof burned off your head. We need to take a lot of care to keep trash picked up ev'rywhere, we need to keep our flues all tight and shut the furnace down at night, we ought to watch for ev'rything that might start up a fire, by jing! We work so hard for what we earn that it's too bad to see it burn, each feller of us should aspire to keep his place from takin' fire."

Says I: "For once I must agree that you have told the truth, by gee, but still we should do more than

that if we would get this thing down pat. Mirandy told me to git her a brand new fire extinguisher, and while I'm at it I'll git some to hang up in the barn, by gum. A fire is just a little thing when it first starts to burn, by jing, a little squirt will put it out, that's why I want them things about where I can grab one mighty quick and make that little fire look sick. I'll tell you, too, what we should do, and all the other neighbors, too; we ought to have a good fire truck, then we won't have to trust to luck, when we've a fire upon our farm, we'll just turn in a fire alarm. That truck will come out on the jump, and with its motor-driven pump it soon will have them blazes killed and we won't have no barn to build!"

A.A.'s Western New York Farm and Home Talk

Your Public Service Commission

By M. C. BURRITT

Public Service Commissioner

If my cistern goes dry, I can build another, or haul water from the creek. But if I want electric central station current and have no line extension by my house, I can't build the line and furnish my own juice. If I can't buy the kind of fertilizer I want, at the price I am willing to pay, from A, I can go to B, or to C. But if I don't like the service or rates of the utility which supplies me with gas or electricity, or telephone, what recourse have I?

M. C. Burritt

We talk about personal liberty, but the fact is, that we have less and less of it. Every year there are fewer things we can do best for ourselves and more and more that some public agency can do for us more easily, more cheaply and more effectively.

We may not want it to be so, but it is the fact.

The more conveniences and material comforts we acquire, the more we are dependent on others to supply them, and service them, and upon the state to control and regulate them.

Our Wants Increase

It is so with the schools. The three Rs are not enough. We must have knowledge and understanding. And physical education becomes necessary for health and happiness. Social and cultural desires must be satisfied. And it all gets beyond us as parents. We depend on the school to do it.

It is so with roads. Some of us used to help draw gravel on the roads and thus work out our road tax. Now, the engineer to lay out the road, the expert to construct it, the highway superintendent to maintain it, are necessary. Building, maintaining, oiling, removing snow from roads, are beyond our and our neighbors' resources.

It is more and more so with public utilities. We could provide kerosene lamps and service them economically. But we can not provide electric station current or gas, or telephones, or public transportation, maintain and service them, and regulate them, individually. This calls for cooperation not only with our immediate neighbors but with all of our fellow citizens.

It all means more cooperation with and more dependence upon corporations and upon the state.

When We Have Kicks

And so when difficulties and dissatisfactions arise we have the right to hold these agencies responsible for adequate and suitable service and just and reasonable rates. The corporation has the first obligation. So it is always well to take up a difficulty or a complaint as to service or rates, directly with the utility first. The company knows most about the matter. It has a direct contractual relation with you. It depends on you for business and should want you to be satisfied. It may not agree with you as to the solution of your problem, it has its own interests to protect. But it should have first chance to satisfy your complaint, and nine times out of ten a frank meeting between you and a company officer or employee will iron out your difficulty, and in most cases satisfy you.

Now, if the utility does not meet your problem, if it does not satisfy you that your difficulty is not a real one and your complaint unreasonable, then the State has provided a court of appeal—the Public Service Commission. The company may not want you to

take up any complaint with the commission, but if you have given the company a chance to answer the complaint first, it is your perfect right to do so.

No Expense Necessary

You don't have to employ a lawyer, or incur large expense, or go through any unnecessary formalities. All you have to do is to write a letter and state the facts—all the facts as you see them. Your complaint will have prompt attention. This is part of the Commission's business. One of its functions is to see that service and rates are just and reasonable. The Commission is an agent of your Legislature, created to serve you as consumers. It is approachable. It wants to be helpful and useful. It is yours to use reasonably. The Commission must be fair to the company. This is in your interest as well as the company's in the long run.

But the Commission must have the facts. It is a regulatory body whose function is to insure service and rates according to law. It can do nothing about general dissatisfactions, nor anything outside the Public Service Law which controls utilities. So, when you take up a matter with the Commission, tell us your exact situation and your specific complaint. Give us the name of the company with whom you are dealing. State your case fully. Be definite. Often a map or a diagram is helpful.

How It Is Handled

Now, the first thing the Commission will do with your complaint,—unless it is based on a lack of information which the Commission can supply—is to submit it to the company and ask it to satisfy you or show why it can not do so. This will be done by letter in the first instance. Conferences may follow. If agreement is not reached, then the case may become a formal one, if it is important. Public hearings will be set, testimony will be taken from both sides, the facts determined, and an order issued by the Commission settling the dispute, which has the force of law.

The Commission never issues important orders, which affect services or rates to consumers without full public hearings, of which public notice is given. To these hearings any one may come and present evidence, either personally or by attorney. There is nothing formidable or expensive about them. They are for the simple purpose of finding out the facts on which to make a just and reasonable determination.

A public utility has a practical monopoly of its particular service in a particular place. Hence it is subjected to state control, in your interest and for your protection. You are entitled to reasonable service at fair and reasonable rates, whether it be transportation, electric, gas, telephone or other utility. One of the Public Service Commission's jobs is to see that you get it. But if you don't tell the Commission of any poor service, or too high rates, and of your inability to get satisfaction from the company after fair trial, how is it to know that you are not getting what you are entitled to? The P. S. C. is at your service.

Recommended Seeding Rates for Lawns

BLACKFOOT BRAND

IDAHO GRIMM ALFALFA SEED

The Big Yield Alfalfa

Blackfoot Brand Idaho Grimm Alfalfa is an extremely hardy strain. Improved for over 20 years in the severe climate of Idaho. A strain that is not susceptible to winter killing. A big tonnage of fine stem hay every year.

Blackfoot Brand Idaho Grimm Alfalfa is grown in a restricted area where every field is registered. The Blackfoot tag shows that every bag has been sealed and certified as to variety and purity by the Idaho State Seed Certification Service. Insist on getting sealed bags labeled with the Blackfoot tag.

Two Dependable Grades

EXTRA NO. 1 (Blue Tag)—Purity 99.50%. No noxious weeds. Free of sweet clover.
NO. 1 (Red Tag)—Purity 99%. Free of noxious weeds. Not more than 1/16 of 1% sweet clover. Practically as good as the Blue Tag grade but a little lower priced.

Both grades are genuine Blackfoot Brand Idaho Grimm and state certified.

Look for the Blackfoot Tag on Every Bag!

The Blackfoot tag is evidence that the seed is genuine and true to name, having been inspected in the field, sealed at the thresher, and checked and resealed through all cleaning operations by state officials. Make sure that the Idaho Grimm Alfalfa you buy bears the Blackfoot tag.

If your local dealer cannot supply you, write us direct.

A Century of Potato Marketing

(Continued from Page 5)

roads still further favored the farmers in the level sections over those in the rough hill counties. As truck transportation to distant cities developed the big trucks found it easier to haul loads of 100 to 250 bushels from the farms on the level stone roads than to climb some dirt road to a hill top. Particularly in the snows and ice of winter and in the mud of spring the hill farmers were largely shut off from this outlet to city markets.

What Is Ahead

What is the future of the New York potato industry in the up-state section? Over a period of more than one hundred years we have seen potato production grow from the position of being little more than a garden vegetable for home consumption or for stock food to that of a record surplus crop in 1914. Then high war wages came and have remained, greatly increasing costs of production where improved machinery could not be used. Our competitors hundreds and even thousands of miles away have been able by new systems of specialized production and marketing to largely capture our markets. We have seen much of the state shift to dairying. Will potatoes come back?

Long Island and the more level up-state soils are able to hold down production costs to where they can compete with distant sections. How about the growers on the rougher lands, often where each farm can grow only a few acres?

A Deficiency Section

These men are now beginning in recent years to have one advantage in marketing that the growers of Ohio, Iowa, southern Michigan, southern Pennsylvania, Connecticut, and New Hampshire have. It is that of living in a deficiency section. Farm Management teachers like our Doctor Warren call a section a deficiency section with respect to any farm product when the total production is smaller than the demand in the nearby cities, and these cities must import part of their supplies from a distance. Aroostock and Idaho are examples of the opposite condition, the surplus section that must ship its product long distances to find a market. The potato grower in the deficiency section has the advantage.

We think of New York City with its immense population as the natural outlet for New York State potatoes. But how many know that the cities and incorporated villages of the state outside of New York City contain over 5,000,000 consumers? We already have one of the finest stone road systems in America, and every year the extension of the cheap town and county roads brings more up-state farms within easy hauling distance of some city market.

Along with railroad movement of potatoes to cities there was always a limited amount of wagon transportation within a radius of five to fifteen miles of each up-state city and village.

So long as the state was a surplus section the price any grower could get was limited by what was paid at the country shipping stations, and there the price was set by the competition of distant states, as Michigan and Maine. A few growers always had a limited personal trade to families at higher prices, but grocers and wholesalers seldom had to pay much more than was paid by the shipper at the railroad station next up the line.

There are still more potatoes grown in Steuben County and a few others than can be sold nearby, and that section still remains a surplus section. The rest of the state has either changed or is changing to a deficiency position. In a favorable crop year like 1924 the

(Continued on Page 10)

for BIGGER PROFITS on Potatoes

EUREKA POTATO MACHINES lower the cost per acre in potato growing. Save time. Save labor. Increase yields. Make more money for you and free you from the hardest work. They're modern, improved, dependable machines, built right to fit each job, and used by successful potato growers for over a quarter century.

Potato Cutter
Cuts uniform seed. Operates with both hands for feeding.

Potato Planter
One man machine. Opens furrow, drops seed, sows fertilizer, if desired, covers and marks next row—all in one operation.

Sprayers

Traction or Power. Insure the crop. Sizes, 4, 6 or more rows. 60 to 150 gallon tanks. All styles of booms.

Riding Mulcher or Weeder
Breaks crusts, mulches soil, and kills weeds when potato crop is young and tender. 11 and 12 ft. sizes. Many other uses, with or without seeding attachment.

Potato Digger

Famous for getting all the potatoes, separating and standing hard use. With or without engine attachment or tractor attachment.

Some Poultry Terms Made Clear

(Continued from Page 3)

there has grown up in nearly all of the eastern states, certification associations, though not always bearing exactly that title. The requirements and methods of doing the work are not exactly alike in any two states, but are very similar. In all states the inspectors or certifiers are trained at the State Agricultural College and must have passed a stiff examination and had several seasons' culling practice. Certification is always official. That is, it is supervised by either the State Department of Agriculture or by the Poultry Department of the State College. The inspector examines the birds one by one as they are passed to him and on each one that qualifies he puts a non-transferable official metal band, bearing the bird's number and the year. The record of the number banded, etc. is kept at the College or State Department.

What Is a Certified Bird?

To qualify for certification a bird must be a year old or more. Pullets are not certified. A hen must weigh 3½ pounds or more if she is a Leghorn, Ancona, or other light variety, and 5 pounds or more if she is of the heavier breeds. She must be free of all standard disqualifications as well as some others that are not standard. She must be in good health, and finally and most important, she must show every indication of being an unusually high producer. There are other qualifications but these are the most important ones.

To produce certified chicks these hens can be mated only to certified males. The certified male is held to similar requirements as the hens and in addition must be from a mother with an official trap-nest record of 200 eggs or more.

"Supervised" Stock

This is a grade of stock more recently established. It is an outgrowth of a change in the certification plan. The males were not always required to be from trap-nested stock. They were certified by inspection the same as the hens. When the grade was raised on certified stock by requiring that males be from pedigreed 200 egg ancestry, the term "supervised" was applied to those flocks that continued under the older system and to what might be called "grade B" hens on the certified farms. That is, "supervised" stock is selected and banded the same as certified, but may or may not be of a little lower grade. Also pullets may be supervised.

Terms Different in Middle West

In the early days of this breed-improvement work each state worked more or less by itself and it is not strange that the terms were not always used in the same sense. This has naturally led to some confusion and efforts have been made to arrive at uniformity of terms in all sections. It is only necessary, however, to remember that in the middle western sections; that is, Ohio, Indiana, Wisconsin, Iowa, etc., the meaning of the terms accredited and certified is exactly the reverse of their meaning in the eastern section. That is, in the states named, the blood-tested, disease-free stock is certified, and the selected-by-inspection stock is accredited.

R. O. P.

As indicated previously, those three letters stand for "record of performance." They mean the same in every state of the Union and in Canada. No chance for confusion here. R. O. P. is the highest grade of breeding stock. To receive an R. O. P. band a hen must have actually laid 200 eggs or more in one year in the trap-nest, and the

(Continued on Page 12)

**"Like
finding
an extra \$4.05
in
each bag"
says Uncle Charlie—**

**1¾ lbs. at
7 Weeks!**

At the right is shown a seven-weeks-old pullet, raised at our experimental farm on B-B Vitamized Chick Starter Ration. She is from a flock of B-B fed pullets which had an average weight of 16.6 ounces at the end of six weeks. Another flock of pullets of the same hatch, raised under identical conditions but fed on ordinary feed showed an average weight of 12.3 ounces for the six weeks. Thus B-B feed alone was responsible for a 26% gain in weight!

THE extra weight, bone and vigor which B-B Vitamized All-Mash Chick Starter Ration adds to a flock has been conclusively proved in a test just completed at our experimental farm. In these tests it was proved that:

With all the conditions equal, chicks fed on B-B Vitamized All-Mash Chick Starter Ration weigh 17% heavier and are worth eight cents apiece more at the end of six weeks than chicks raised on ordinary feed. The mortality rate among the B-B fed chicks was 2% less than among the chicks raised on ordinary feed.

The tests prove that the extra value brought about by heavier, huskier chicks and lowered mortality amounts to \$4.55 additional income from each bag of B-B Vitamized All-Mash Chick Starter Ration.

One Cent Per Chick

The extra cost of feeding chicks on B-B feed right through those critical first six weeks is *only one cent per chick* or not to exceed fifty cents a bag. So a simple problem in arithmetic shows that when you use B-B Vitamized All-Mash Chick Starter Ration it is just like finding an extra \$4.05 in each bag that you feed!

The Growth and Vigor Vitamins A and B, the Sunshine Vitamin D, all so necessary to chick life and development are contained in ample quantity in B-B Vitamized All-Mash Chick Starter Ration through such health-giving ingredients as

Milk Sugar Feed, Cod Liver Oil, Dried Butter-milk, Alfalfa Leaf Meal, Linseed Oil Meal, Meat Meal, Fish Meal, and other health-providing concentrates and minerals, all in perfect balance.

At six weeks of age the B-B fed chick should be gradually changed over to B-B Vitamized All-Mash Broiler and Growing Ration, a feed having all the Vitamins, minerals and health-giving concentrates of B-B Starter Ration and accurately balanced for the older growing bird.

Our Money Back Guarantee

To prove that B-B Vitamized All-Mash Chick Starter Ration and B-B Vitamized All-Mash Broiler and Growing Ration will give you best results, we make this offer. Get a supply from your dealer. Feed it to a part of your hatch and compare with any feed you choose to use for the balance. If B-B doesn't produce sturdier, better-feathered chicks, if it doesn't eliminate rickets and cut mortality rate, if it doesn't result in heavier broilers and earlier layers, return the empty bags to your dealer and he will cheerfully give you back every cent of your money.

Here is a chance to join the big family of poultrymen who feed B-B without the risk of a penny. No better time than right now to start.

Maritime Milling Co. Inc.

Reviewing the Markets

Milk Prices
March Prices
Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		
2A Fluid Cream	1.66	
2B Cond. Milk		
Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
Hard Cheese	1.50	1.30
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for March 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Market Still Unsettled
CREAMERY SALTED Mar. 20, Mar. 13, Mar. 21, 1931 1931 1930
Higher than extra 30 -30 1/2 30 1/2-31 38 1/2-39 1/4
Extra (92 sc.) 29 1/2-30 - 38 1/4-
84-91 score 25 1/2-29 25 1/2-29 1/2 32 -38
Lower Grades 23 1/2-25 23 1/2-25 30 -31

The butter market opened on March 16, in an unsettled condition and continued to vary from day to day the same as it has been doing for several weeks past. There are any number of factors that are responsible for this constant changing. In the first place, at this season of the year the butter market is always more or less flighty. To aggravate this we have the critical situation that faces all lines of trade, and keeps business in hot water.

The market opened unsettled on Monday and prices slipped from 29 1/4 for creamery extras down to 29 1/2c. At the lower figure business improved and the market closed firm. On Tuesday an unexpected easiness developed following reports from Chicago of a 1c break in that market. In spite of that, however, the New York price held to 29 1/2c.

Wednesday's market opened unsettled and easier. Further weakness was reported at Chicago and the bears got busy. As a result prices were knocked down to 29c. There are some sales at 29 1/4c and 29 1/2c for creamery extras, these prices being paid by critical buyers who have been finding it difficult to fill their trade needs from the ordinary run of 92 score butter.

Thursday's market received little active support. This was much in contrast to the situation in the West, Chicago prices advancing above par with New York. On Friday, however, the change did come, with a steady tone and increased firmness characterizing the trend of trade. There was some ordinary 92 score butter available at 29 1/2c but those who were critical were paying 29 1/4c.

No Change In Cheese

STATE FLATS	Mar. 20, 1931	Mar. 13, 1931	Mar. 21, 1930
Fresh Fancy	16-17	16-17	18 1/2
Fresh Average			
Hard Fancy	21-22 1/2	21-22 1/2	24 -26
Hard Average			23 -

There is practically nothing to report in the cheese market. Toward the end of the week ending March 21, there was slightly improved buying interest, although most of the trading is in small lots. There is just enough undertone in the Wisconsin market to lead us to expect a little firmer trend although it is so slight that it may never develop.

Heavy Receipts Hurt Egg Prices

NEARBY WHITE	Mar. 20, 1931	Mar. 13, 1931	Mar. 21, 1930
Hennery			
Selected Extras	25 -26 1/2	26 1/2-28	32 -
Average Extras	24 -	24 1/2-25	29 1/2-30
Extra Firsts	22 1/2-23	23 1/2-24	28 -29

Pewees			
NEARBY BROWNS	Mar. 20, 1931	Mar. 13, 1931	Mar. 21, 1930
Hennery	24 -26	26 -27 1/2	29 1/2-32
Gathered	21 -23	22 1/2-25 1/2	26 1/2-29

The egg market opened at 28c for closely selected extras on March 16. Supply and demand got at work and down went the price. Practically every day has found the egg market facing heavy supplies. The retail prices have been moving upward of late and Mrs. John H. Housewife has immediately used the reverse gear. She knows from the newspaper and radio reports that eggs are plentiful and therefore, objects to unwarranted advances. As a result, the distributing trade has been quiet. With this situation existing speculators naturally have ceased to operate realizing that their time is coming. Under the circumstances nearby eggs have been in accumulation, receivers re-

fusing to store at the higher quotations. On Tuesday the market continued unsettled and closely selected extras went to 27 1/2c, meeting poor demand and stocks accumulating. The weakness continued on Wednesday with closely selected nearbys at 26 1/2c and at the same time experiencing heavy pressure. Thursday's market continued unsettled, although prices were not changed. At 26 1/2c for closely selected extras many receivers decided to hold, expecting a better Easter trade. On Friday, there was better trading although the market opened with 1/2c reduction. At the close 26 1/2c represents the average for closely selected extras with some premiums being paid.

Live Poultry

The situation in the live poultry market closed a little mixed. At the middle of the week colored fowls were selling up to 27c. A great deal of the stock being forced out at a premium. Leghorn fowls were bringing 24c. However, the consuming public reacted against this advance and on Friday, colored fowls were bringing from 22c to 24c and Leghorns 21c to 23c. Colored stock suffered worse than Leghorns. As the market comes to a close the broilers are also experiencing considerable pressure but after resisting a downward revision finally broke from 2c to 3c per pound. Rock broilers had been selling up to 40c. Hen turkeys are experiencing the reverse of fowls for fancy hens are bringing 42c and ordinary stock brings 40c. Poor quality birds and old toms are only bringing 30c. Capons continue to experience a very satisfactory demand.

Again we call the reader's attention to the Hebrew holiday next week. The best market days will be March 30 and 31, so time your shipments accordingly. Furthermore, do not ship any clucks for only choice quality poultry is wanted.

Meats and Livestock
CATTLE—No steers offered. Few nearby low cutter and cutter cows steady from \$2.00-3.50. Bulls steady. Cutter to medium \$4.00-5.25.
VEALERS—Small lot cull and common light weight vealers \$4.00-6.50, considered steady. No better grades offered.
HOGS—Load medium grade heavy weights steady at \$7.25.
COUNTRY DRESSED CALVES—Receipts were liberal to heavy all the week, but owing to a light supply at the Western dressed receiving houses trading for country dressed calves was good up to and including Thursday and prices advanced. Friday's receipts were again heavy and buying not so active. Market closed steady with an easier feeling and not cleaning up. Fresh receipts per pound: Choice, 14-16c; fair to good 11-14c; small to medium 7-11c.

HOTHOUSE LAMBS—Receipts liberal during the week. Demand slow and for fancy only. Undergrades hard sellers some carried over daily. Market closed weak and lower and unchanged from last week. Good to fancy, each \$7.00-9.00, a few higher; fair to good \$5.00-7.00; imitations, each \$2.00-4.00.
LIVE RABBITS—Receipts light to moderate during the week. Demand fair at improved prices. Market closed steady at 15-22c per pound, a few higher.

In the Produce Market
Old potatoes are holding steadier. Fancy Maines and Long Islands bring up to \$3.25 per 150 pound sacks. Some Maines as low as \$2.75, with some Long Islands at \$3. Bulk goods from Maine bring \$3.10 to \$3.50 per 180 pounds, while Long Island goods bring \$3.60 to \$3.85.
Now that it is getting late to ship old cabbage, the price is beginning to improve. The market is stronger on good stock, bringing from \$19 to \$21 per ton. Supplies of old crop cabbage are limited. Carrots are meeting a weak market. It is difficult to get a line on definite values

American Agriculturist, March 23, 1931
because old carrots from upstate are being forced out at all sorts of prices, ranging from 50c to \$1.
Onions are a shade firmer. Orange County yellows and reds have been bringing \$1.00 to \$1.25 per hundred in the stores. No pier sales of Western New York yellows were reported on Friday.

A Century of Potato Marketing

(Continued from Page 7)

state may grow 42,000,000 bushels and Erie, Monroe, and Onondaga Counties shipped 284, 1,120, and 995 carloads each, with up-state total of 14,466 cars. In 1925 with poor conditions the state grew 23,320,000 bushels and these three counties dropped to 4, 102, and 64 cars respectively. The great cities of Buffalo, Rochester and Syracuse had taken nearly all they raised, while the year before those counties had been forced to hunt for markets by rail.

The wholesaler and the grocer care not one straw where their supplies come from. Each must please the consumer, and if the consumer prefers Aroostook or Idaho potatoes to up-state New York's, then the New York grower is badly out of luck. If the New York grower can grow and market as well or better than his competitors, he will get the business, and a price equal to what his grower competitor receives, plus all handling costs, including those of the shipper, freight, sacks, protection against freezing in transit in winter, costs of the wholesale produce store in the city, and in the case of direct sale to grocers, that of trucking from wholesaler to grocery.

Kill Rats Without Poison

A New Exterminator that
Won't Kill Livestock, Poultry,
Dogs, Cats, or even Baby Chicks

K-R-O can be used about the home, barn or poultry yard with absolute safety as it contains no deadly poison. K-R-O is made of Squill, as recommended by U. S. Dept. of Agriculture, oven-dried under the Connable process which insures maximum strength. Used by County Agents in most rat-killing campaigns. **Money-Back Guarantee.**
Insist upon K-R-O, the original Squill exterminator. All druggists, 75c, \$1.25, \$2.00. Direct if dealer cannot supply you. K-R-O Co., Springfield, Ohio.

Farm News from New York

Hewitt Bill Becomes a Law -- Fruit Growers Cooperate

THE signing of the Hewitt Bill by Governor Roosevelt last week gives the Adirondack Park an area of 4,604,000 acres and makes it the largest park in the United States. The new blue line will bring under State control, all desirable forest preserve land in the Adirondacks, which will be protected against any timber-cutting and against forest fires by the State Conservation organization.

The park provides a place in our own state where one can spend a pleasant vacation in a state-maintained preserve offering scenic beauty and recreation spots that can be found in no other place east of the Rockies. Incidentally, the new extension makes Adirondack Park even larger than the Yellowstone National Park of the West.

Fruit Growers Cooperate

THE officials of the Hudson Valley Fruit Exchange, whose membership of approximately five hundred in Ulster and Orange Counties conduct a large fruit business, report a prosperous season for the year just passed. One-third of the 1930 business, totalling \$1,500,000 was handled through three plants, owned by the Exchange at Marlboro, Milton and Ulster Park.

The fruit growers in the Hudson Valley are finding that cooperation combined with good business methods will secure the farmer the maximum returns for his labor.

Farm Population Growing

ACCORDING to a report from the Bureau of Agriculture and Economics, fewer people are leaving the farms and births on the farm are ahead of deaths. There is less tendency to leave the soil now than there has been for a number of years.

During 1930 a smaller number of people left the farms for towns and cities than since 1924. The movement from cities to farms in 1930, on the other hand, was the largest since that time. Evidently, people are finding that all the gold is not to be found in the cities and more people are realizing that actually they are as well off on the farm as in the city.

Flower Show in New York

IHAD the good fortune last week to be able to attend the Flower Show held at the Grand Central Palace in New York City.

The entire three floors devoted to flowers of all kinds were crowded with people anxious to see the latest and best in this line. It is amazing what a transformation a few flowers and properly placed shrubs can do to a commonplace yard or lawn. I wish that more of our readers could see the wonderful landscape designs by the country's leading architects.

One of the things that we as farmers sometimes fail to realize is the wonderful opportunity we have to brighten the farmstead with flowers and shrubs. The chief difficulty in suburban areas is the lack of space. On the farm, we have an abundance of space but the instances are all too few where it has been properly utilized. A yard filled with flowers is one of the best advertisements of the farm. Why can't we have more of them?

Regional Dairy and Poultry Cooperative Formed

THE Federal Farm Board announced the recognition of the Dairy and Poultry Cooperatives, Inc. as a regional marketing association for the handling of dairy and poultry products. The new association will center the sales activities of cooperatives operating in sixteen states, with headquarters in Chicago.

The various member associations last year handled products valued at nearly twenty billion dollars. Since most of the member associations are from central and middlewestern states, the effect of the combination will probably be felt here in the East. It will probably mean that the poultry and dairy products of New York

State will have more competition in the future than they have in the past and will make it even more imperative that we produce a product as good or better in quality and see that it is placed in a favorable position on the market.

S. H. Thompson New Farm Board Member

S. H. THOMPSON of Chicago, president of the American Farm Bureau Federation, will fill the vacancy in the Federal Farm Board, created by the resignation of Alexander Legge.

Mr. Thompson is a practical farmer and his addition to the Board as a representative of the organized farmers should be welcome. Mr. Thompson has long been interested in agricultural work. He has

the young granger to aid in the elimination of local highway hazards and the improvement of safety conditions. In addition, there is the possibility of a state and national award to the writer of the best essay.

There will be six national prizes, first prize consisting of a trip to the National Grange at Madison, Wisconsin next Fall, with all expenses paid. The other five prizes are checks for fifty, twenty, fifteen, ten and five dollars.

Each state will give a medal for the best essay in addition to a check for \$5.00. The closing date for the state contest is July 4. Here is an opportunity for juvenile grangers to see what they can do.

High Producing Hens

THE report from the R. O. P. work in poultry just lately come to our hands from both the Pennsylvania and New York associations provides an interesting comparison. New York has the high individual hen—a White Leghorn pullet owned by Cloverdale Farms of Cortland County, who laid 335 eggs during the year. Nineteen birds in New York laid better than 300 eggs during the 12 months under supervision.

Pennsylvania's high hen is owned by B. W. Jacobs of Greene County, a White Leghorn laying 327 eggs during the year.

Pennsylvania has 25 birds, that, according to the record of performance, laid more than 300 eggs.

Goshen Young Farmers' Association News

AFATHER and son banquet of the Goshen Young Farmers' Association was held at the Orange Inn, March 12, 1931. Thirty-five persons attended the banquet.

Benjamin Sawyer, President of the G. Y. F. A., acted as toastmaster. The main speaker for the night was H. B. Knapp, from Farmingdale, Long Island. He spoke upon "These Changing Times."

In addition to this nine members of a short course for feeding and managing cattle, given by the Agricultural Department, were presented diplomas by Charles J. Hooker, principal of the Goshen Public Schools. These diplomas were given for maintaining a satisfactory grading in the course.

G. D. Musser, County Agent of the Orange County 4-H clubs, was among those present.—PETER KRATJE, Goshen, New York.

Shipments to Drought Area Continue

DESPITE the snow-filled roads, and bad weather, the shipment of produce to the drought areas has continued. More than sixty cars of produce have been shipped by the farmers of our New York State counties in cooperation with the Farm Bureau and other agencies. We are proud of the fact that even though the farmers of the State have not had any too good a season, they are still able to recognize those who are in greater need.

Fish Spearing Allowed

THE use of spears to catch mullet, carp, dogfish, catfish, bull heads, suckers and eels will be allowed in waters of the State not inhabited by trout, except in certain prohibited areas. Fishermen should secure a copy of the new order from the State Conservation Department.

Western New York Notes

SATURDAY morning, March 14, at Orchard Park, Erie County, New York, three cars were standing on the B. R. & P. siding and everything was in readiness for the big loading bee of food products to be sent by Erie County farmers to the drought-stricken South.

Richard Fricke, Manager of the Erie County Farm Bureau said—"We expect to load two cars, easily. It is a question whether or not we will have enough donations to completely fill the third."

Niagara County loaded its car in record

time Thursday at Lockport. Several truckloads of surplus supplies were taken to Medina to be loaded into the Orleans County car.

The Niagara Frontier Growers Co-operative Market at Clinton and Bailey Streets, Buffalo, had its opening Monday, March 16.

It covers an area of ten acres. Ten additional acres are available for expansion, and it is modern and up-to-date in every respect. There are 700 stalls for use by the growers, the selling aisles are 24 feet wide, and the streets 84 feet wide so there need be no congestion of traffic. There also is a suitable administration building. Officers are Henry G. Marquart, President; Thomas Marks, Vice President, and Albert Schillroth, Secretary-Treasurer.

There is a board of twelve directors and a membership list of approximately two hundred.

The three highest officials of the Erie Railroad also took a prominent part in the opening exercises.

New York County Notes

GENESEE COUNTY—Farm machinery still remains high. Horses are cheaper. One can get a good young team for \$250. A great number of the auctions are cash sales.

Two cucumber growers' meetings were held in this county on March 9 at Batavia and Leroy. Dr. Charles Chupp of the Plant Pathology Department and Professor F. O. Underwood of the Vegetable Department, New York State College, were the principal speakers. Dr. Chupp spoke on plant diseases and spraying and Professor Underwood discussed the variety and kind of fertilizer used.

Roy A. Porter of Elba, one of Genesee County's greatest potato growers, gave a talk "Who should grow potatoes?" over radio station WGR, Buffalo, on March 11. Mr. Porter is senior member of the Porter and Bonney farm which grows an acreage of 150 acres of potatoes each year. They also grow onions, lettuce and spinach on their 320 acres of muck land.—MRS. R.E.G.

WYOMING COUNTY—Some sugar makers tapped just before the snowstorm, and the Attica State Prison farm is reported to have had a considerable run of sap from their 1500 trees under tap. Some farmers tapped just because of general principles but the majority will in a few days be in the full swing of sugar making. There is considerable old syrup on the market and the price of the new is quite low, some dealers to pay only 75 cents per gallon for the first of the crop.—A. S.

When Writing Advertisers, Be Sure to Mention American Agriculturist

A. A. On the Air

WE want to call the attention of our readers to the fact that the A. A. is on the air several times each week. Every Monday, Wednesday and Friday from 12:10 to 12:15, there is a news broadcast over WHAM of special interest to central and western New York readers, also on Tuesdays and Saturdays at the same time. Editor "Ed" comments on topics of interest to farmers.

Aunt Janet has the same period on Thursday over WHAM, touching on subjects of special interest to the homemaker. In addition to our broadcasts over WHAM, each week on Wednesday during the noon hour, we give a 5-minute news summary covering topics of general interest to eastern agriculture over WGY.

Mr. Eastman presents an editorial over WGY on Monday at the same time.

In addition to the above, we also give a short news broadcast during the National Farm and Home Hour over the National Broadcasting System at Chicago, on Tuesday noon of each week.

been connected with the Farm Bureau for many years being president of the State Farm Bureau before being head of the Federation, which position he has held for some time.

Mr. Thompson is well acquainted with the economic status of American agriculture and has been directly connected with relief work in the past six to eight years. It is expected that he will work generally with the Board and devote his entire time to it.

Mr. Edward A. O'Neil of Montgomery, Alabama, who has been Vice President of the American Farm Bureau Federation, was elected President to succeed Mr. Thompson on his resignation.

Start School Forest

AGIFT of 126 acres to the Board of Education at Trenton, Oneida County, was the start of what will be the largest school forest in the state. Mr. K. E. Johnson, teacher of vocational agriculture in the Holland Patent High School, was interested and got in touch immediately with the Conservation Department.

The department is to furnish trees free and planting is to be done by school children on Arbor Day.

The largest school forest, previous to the one in Trenton is in the town of Watson, Lewis County, consisting of 98 acres.

National Grange Contest Announced

MR. L. J. TABER, Master of the National Grange, announced last week plans for the annual highway safety contest open to members of the grange, who are under 18 years of age. The subject of the essay that is to be written for the contest is: "What can the grange do to further highway safety?"

The contest offers an opportunity for

KERR'S NEW LOW PRICES

PLACE your order now for Kerr's Lively Chicks. These prices are attractive for chicks that have a rich laying inheritance from birds that have made big records in leading egg-laying contests.

(Continued from Page 9)

owner's word is not enough. She must have done this at an official egg-laying contest, or at home under official inspection. The records are sent in for examination every month and in addition an inspector (not the same as the certifier) makes monthly or bi-monthly visits to the farm unannounced. While there he does all the trapping and weighs the eggs as they are laid. If her eggs are the least bit off color or below weight, a hen cannot receive her R. O. P. band. R. O. P. males are vigorous, standard type, free of defects, and are sons of R. O. P. mothers that have laid 225 eggs or more in a year. It is possible to have supervised, certified, and R. O. P. flocks all on the same farm and to have all of them accredited, and it is often the case.

It should be evident from this bare outline, which could easily be expanded into a good-sized book, that the poultry breeders have a well-defined "breed improvement program." It is the result of slow but steady advancement toward an ideal. That results are being achieved is indicated by the constantly improving appearance of eggs that go to the markets, by the increase in the average flock production, and by the increase in average flock production, and by the large number of birds that are admitted to the R. O. P.

Depreciation Versus Oats

(Continued from Page 3)

their neighbors, and in that way realize considerable added income from their machines.

For custom plowing, the charge is usually about \$2.00 an acre. Under difficult soil conditions or where a heavy drag is pulled behind the plow, the charge may be a little more than this, but \$2.00 is not far from the average. In most communities, the man who operates a small farm and has time to plow for neighbors will find a demand for his services at this rate.

Profits from custom work tend to increase with the size of the tractor. If a man plows eight acres a day with a two-plow outfit, his gross income is \$16.00. With a three-plow tractor, 12 acres of plowing yields \$24.00. Generally, the larger tractors cost less to operate per acre covered, which is in their favor for custom work. Also, the driver of the larger machines accomplishes more as an individual and consequently receives more pay for his time.

Custom work need not be limited to plowing. It may be field work, belt work or road work. In many neighborhoods, the number of small, partnership owned threshers is on the increase, and someone must furnish tractors to operate them. If the owner of the tractor is paid \$1.50 an hour for a hundred hours or so of work, he adds considerably to his income from the tractor for the year.

Tractors and tractor implements can be used most efficiently if fields are made as nearly square or rectangular as possible, and if obstructions such as stones and stumps are removed. It has been found that less time is wasted in turning in long, narrow fields than in a field of the same size which is shorter and wider. Short fields also cause much more idle travel when handled in lands.

Whether his farm is large or small, a tractor owner will find that keeping records will pay him for his time and trouble. A chart on the machine shed wall or a record book in the tool box, if filled out daily, will contain a lot of interesting and valuable information at the end of the season. Here are a few items of information that can easily be jotted down: Fuel used, lubricating oil used, kind of work, number of acres, number of hours, location of work, the date. It is generally a good idea to have a space on the record for any additional comment or observation which may seem appropriate.

Records of this kind not only enable a man to determine his own costs but they help him to decide what he should charge for custom work. In the case of custom work, he should remember to figure in the overhead charge as well as costs for fuel and lubricants.

Don't Experiment!

DRIVE A LITTLE SLOWER

OUT on the good roads in your fine car it is possible to cover a couple hundred and more miles a day.

But you'll miss much of value as you hurry along. Here a noted monument, there a beautiful waterfall, at the top of that wooded ridge an enchanting view. They are all here, if you please, for your pleasure and enjoyment. It is worth while to tarry here and there and take note of the wonders by the way. Alas, all too frequently it isn't done.

Your auto trip is a pretty good illustration of the way many people drive, unheeding, through their papers and magazines.

The advertisements, always interesting, and containing helpful suggestions, are passed over lightly, often without even a passing glance. And yet here may be peeping out at you the one thing of real value in your day's reading!

Something new. You should know of it, and you may. Possibly something you need now, or will need by and by. The useful things, the better things. All as attractively spread out before you as any thing your publication contains. Why skim along with your eyes closed to things of such value?

Suggestion to Reader Drivers: Drive slowly through the advertisements. Watch for stop lights. Get the AD-reading habit. The advertisements are placed before you for your information and profit.

Long Island—The Sunrise Country

(Continued from Page 2)

which sell at from fifty to seventy cents so that the feathers just about pay picking costs. In dressing a duckling nothing is taken from them except the feathers and the small amount of blood that comes from cutting the jugular vein. So they lose only three to five ounces in dressing—a much smaller shrinkage than is involved in the five hour journey when shipped alive to New York. Hence, we have the surprising fact that a dressed duckling sells for a lower price per pound than a live one but regardless of price, the important Jewish trade will accept only live birds.

Life Is Short for a Duck

A well-cared-for duckling will be ripe for market in twelve weeks from the day it is hatched and should then weigh from five to six pounds. This is absolutely the maximum relative rate of growth of any meat animal. No wonder it is a tender, juicy, and delicious product.

During the last few years prices have ranged between 18 and 36 cents per pound. They tell me that at the smaller price even the most skillful growers lost a little money. I found a duck ranch a most worth-while place to visit and the business most interesting to talk about but, on the other hand, I do not feel the least bit inclined to advise my readers to diversify their farming operations by adding ducks. On the contrary, my philosophy is quite the opposite. Not only had the shoemaker better stick to his last but the farmer had better stick to the business which he knows most about and which has proved itself suited to his conditions. These duck growers have made money but not every year. They are skilled men—past masters in their business and in addition have peculiar advantages in markets, physical location, and sales organization. I feel as if the man who tries to compete with them at their own game will have hard going. But be this as it may, the production of Long Island Ducklings is a splendid example of intensive, highly skilled, high pressure manufacture.

headed by the bold, handsome signature of John Hancock, the great Merchant Prince of Boston and closing with the names of the three Delegates from Georgia. They were, on the whole, a picked group of men including among their number some of the wisest and best known citizens of the Colonies.

There are a goodly company of Floyds here in this lonely God's-Acre but William, the Signer, lies not here among his forebears but up in Oneida County north of Utica where he had a large estate and where he died in 1821 at the ripe old age of eighty-seven. In that county the name of the township and village of Floyd still commemorates his fame. The family plot, however, does contain a memorial to him, a large marble slab lying horizontally but supported two or three feet above the ground by four marble pillars. Dense evergreens over hang it and while there was no snow on the Island, it had sleeted heavily and the long, time-worn inscription was so covered with ice that we gave up the effort to decipher it. Looking at this tablet to the memory of a man whose remains lie far away I was reminded of that curious epitaph,

*"Here lies the body of John Mound
Lost at sea and never found."*

Close beside the folk they served in their lives there lie also the slave retainers of the Floyds. I copied their names from the markers. They were Charles, Caesar, Harry, Sam, Pompey, Lon, Isaac and Cyrus. It was a day when men named their slaves as casually and informally as they did their horses or dogs. But in any case there they lie—Master and Man, keeping company in the opening in the woodland by the sea, Peers each of the other at the last. One wonders why there seem to be no markers for their female slaves, their forgotten Dinahs and Betseys and Jinnies.

The Manor of St. George

In the reign of William and Mary about the year 1692 there was granted to one Smith a great tract of land that ran across the Island from the Ocean to the Sound and ten or more miles from east to west and comprising the very heart of the Island. It was an imperial domain in its day and its official title was "The Manor of St. George". Time was when we had a good many of these great baronies in our state, but in most cases the families to which they were granted have let them slip away from them until of their once great possessions there remains hardly an acre that they can call their own. Not so with the proprietors of this ancient grant. I am glad to remember how we were received into the Manor House, portions of which were built previous to 1700, and how we met the Gentle-Folk who still hold an ample remnant of their ancestral acres and how on the parlor wall I read the framed Royal Letters Patent bearing the Great Seal and the signatures of William III and of Mary, his consort. It would make a great story if one could write in detail the history of this Manor and the folks who have held it so long.

I Am Initiated

And then finally at evening—it was a good close to a good day—my friends dined me with an organization which meets every Saturday night in East-port—at least I think that was the name of the place although I cannot keep these South Shore towns apart in my mind. I believe the full corporate Title of the organization is "THE ANTI-QUES". Its services might pass for a Rotary or Kiwanis luncheon with all the frills left off. I am told that there are neither dues nor by laws, but once you have been privileged to eat with them you are forever afterwards an active member in good and regular standing.

In such fashion did my friends offer me hospitality that I can never repay. Do you wonder that I have a certain fondness for this Happy Isle which geographically and racially is a part of Connecticut rather than New York?

Post Your Farm And Keep Trespassers Off

WE unreservedly advise farmers to post their land. The signs we have prepared are worded to comply with Conservation Law.

Per Dozen	\$ 1.00
Per Fifty	3.50
Per Hundred	6.50
Per Thousand	60.00

Specially worded signs will be made up at slight additional cost. Names and addresses will be imprinted at \$2.00 for the first one hundred and \$1.00 for each additional one hundred.

These signs are made up of extra heavy cloth material that will withstand the severities of the weather.

To avoid loss of cash in mail, send check or money order with order.

Tested Recipes

Serving Familiar Foods in a Different Form

Sausage Loaf

Cook one pound of seedless raisins until tender, drain off syrup and to it add one teaspoonful saleratus, one pound pork sausage ground fine and two pounds of brown sugar. To this add one-half teaspoonful nutmeg, one teaspoonful cinnamon, and two and one half cupfuls of flour. Stir thoroughly, dredge the raisins in flour, and add these to the mixture. Stir in one cupful nut meats and bake in two bread loaf pans in a moderate oven. Shredded citron may be added if a richer cake is desired. These cakes will keep for weeks in a covered crock. Time for baking nearly two hours.—L. M. T.

Our testing kitchen states that there should be at least one cup of syrup after boiling the raisins. Then if the mixture is slightly dry it may be thinned with a very little hot water.

Holiday Oysters

Make a rather thick cream sauce of two tablespoonfuls of butter, three tablespoonfuls of flour, the liquor from the oysters, and a seasoning of salt and pepper. Stir in cupful of inner

hearts of celery, cut rather fine and cook five minutes. To one-half cupful grated American cheese add two tablespoonfuls chopped pimentos or a dash of cayenne pepper, and stir these into the hot sauce. Cover the oysters with hot milk and simmer until their edges

Right for Afternoon Wear

3039

DRESS PATTERN NO. 3039 is a good spring style which adapts itself to a great many occasions, for luncheon, for street wear, or for afternoon use. The peplum has been lowered to give greater emphasis to the flat slimness of the hip line. In the bright silk prints of early spring, with bows and buckles either to match or in contrasting colors, this dress could be used for almost any occasion except for formal wear. The pattern may be had in sizes 14, 16, 18, 20 years, 36, 38 and 40 inches bust. Size 16 requires 3 3/4 yards of 39-inch material. Price, 15c.

curl, add to the white sauce and serve in pastry cases in biscuit cups from which the soft inner portion has been removed or on slices of buttered toast.—L. M. T.

The amount of sauce given here is about right for a quart of oysters.

Kentucky Potatoes

Select medium-sized sweet potatoes, pare and cut in half-inch slices. Put potatoes in buttered baking dish, add two small cupfuls of hot water, one cupful of brown sugar, and four tablespoonfuls of syrup (maple syrup is delicious). Dot top liberally with butter and bake until the potatoes are tender. Serve hot.—L. M. T.

If you do not crave sweets the amount of sugar may be reduced slightly in this mixture. Covering the dish will prevent its drying out too much. Remove the cover to allow it to brown.

Food which has browned on baking dishes may be removed with steel wool or a friction cleaner.

Slenderizing Smartness

3026

DRESS PATTERN NO. 3026 has been thought out especially for the mature figure. The cross-over bodice with cross-over vestee, the fitted hip, and a slightly circular skirt all combine to furnish the effect of slenderness for figures which must watch their lines. Plain navy blue silk crepe with a white vest or a tweed wool jersey in monotone blue mixture would be stunning in this design which cuts in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust. Size 36 requires 3 3/4 yards of 39-inch material with 3/4 yard of 35-inch contrasting. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. Add 12c for one of the spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street Poughkeepsie, N. Y.

TWO HELPERS INSTEAD OF ONE IN EVERY BAR

That's why

WASHING WORK-CLOTHES WITH FELS-NAPTHA IS LESS WORK FOR YOU

Two helpers instead of one! There's the secret. Two active helpers working hand-in-hand—loosening greasy, ground-in dirt without hard rubbing—making the grimeiest work-clothes clean and bright with less effort on your part.

Meet these two helpers. Unwrap the big Fels-Naptha bar. You'll smell naptha. Plenty of naptha, the grease dissolver, teamed with good golden soap. And every time you use Fels-Naptha you get the extra help of these two busy cleaners. Extra help whether you soak or boil; whether you use tub or machine; hot, lukewarm or cool water. Extra help whether you're washing out a pair of overalls or doing the whole family wash.

Fels-Naptha helps keep your hands nice, too. For it contains soothing glycer-

ine. Ask your grocer for Fels-Naptha today. Try the 10-bar carton. You'll soon know why millions agree that Fels-Naptha is the real washing bargain. Not more bars, but more help! Extra help that saves you!

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-3-28, Fels & Company, Philadelphia, Pa.

Just David--By Eleanor Porter

THE STORY THUS FAR

Because of failing health David's father, a violinist, decides to leave the mountain home where they had lived alone for six years. They start down the mountain on foot, but strength fails the man before they go far. A farmer gives them a lift for a way and they decide to spend the night in a nearby barn where Simeon Holly and his wife find them. David's father is dead.

David is lonely but several new friends make life more pleasant for him. There is blind Joe Glaspell who plays the violin, Jack and his sister, Jill, who rescue him when he gets into a fight over a kitten, and his "Lady of the Roses" who lives in the beautiful house on the hill.

David cannot understand why his Lady of the Roses and Jack are not on good terms. His Lady tells him that none of her hours are happy ones, and when David tells this to Mr. Jack it seems to start him thinking.

When David fails to visit Jack and Jill and his "Lady of the Roses" for a week, they make inquiry and discover that David is dangerously ill.

When David is on the road to recovery, all his friends visit him. Jack leaves suddenly by way of the window to avoid meeting the Lady of the Roses. On his next visit to David he could not avoid meeting her.

David tells his Lady of the Roses the story of the princess and the pauper just as Jack told it to him. David does not like the ending and the Lady of the Roses says she does not like it either. She makes up a different ending and asks David to tell Mr. Jack about it.

Again Mr. Jack sprang to his feet. For a minute he strode up and down the room in silence; then in a shaking voice he asked:—

"David, you—you aren't making all this up, are you? You're saying just what—what Miss Holbrook told you to?"

"Why, of course, I'm not making it up," protested the boy aggrievedly. "This is the Lady of the Roses' story—she made it up—only she talked it as if 't was real, of course, just as you did. She said another thing, too. She said that she happened to know that the Princess had got all that magnificence around her in the first place just to see if it wouldn't make her happy, but that it hadn't, and that now she had one place—a little room—that was left just as it used to be when she was the girl, and that she went there and sat very often. And she said it was right in sight of where the boy lived, too, where he could see it every day; and that if he hadn't been so blind he could have looked right through those gray walls and seen that, and seen lots of other things. And what did she mean by that, Mr. Jack?"

"I don't know—I don't know, David," half-groaned Mr. Jack. "Sometimes I think she means—and then I think that can't be—true."

"But do you think it's helped it any—the story?" persisted the boy. "She's only talked a little about the Princess. She didn't really change things any—not the ending."

"But she said it might, David—she said it might! Don't you remember?" cried the man eagerly. And to David, his eagerness did not seem at all strange. Mr. Jack had said before—long ago—that he would be very glad indeed to have a happier ending to this tale. "Think now," continued the man. "Perhaps she said something else, too. Did she say anything else, David?"

David shook his head slowly.

"No, only—yes, there was a little something, but it doesn't change things any, for it was only a 'supposing.' She said: 'Just supposing, after long years, that the Princess found out about how the boy felt long ago, and suppose he should look up at the tower some day, at the old time, and see a one—two wave, which meant, "Come over to see

me." Just what do you suppose he would do?' But of course, *that* can't do any good," finished David gloomily, as he rose to go to bed, "for that was only a 'supposing.'"

"Of course," agreed Mr. Jack steadily; and David did not know that only stern self-control had forced the steadiness into that voice, nor that, for Mr. Jack, the whole world had burst suddenly into song.

Neither did David, the next morning, know that long before eight o'clock Mr. Jack stood at a certain window, his eyes unswervingly fixed on the gray towers of Sunnycrest. What David did know, was that just after eight Mr. Jack strode through the room where he and Jill were playing checkers, flung himself into his hat and coat, and then fairly leaped down the steps to—

"Under Frozen Stars" Our New Serial

THOSE of our readers who remember The Valley of Voices by George Marsh, published by us as a serial several years ago, will be eager to start "Under Frozen Stars" by the same author.

The Valley of Voices was one of the best adventure and mystery stories we ever published, but you will find that "Under Frozen Stars" is equally as interesting and exciting.

The scene is laid in the Canadian North Country where trapping and lumbering are the principal activities and concerns a fight to the finish between two companies who are trying to monopolize the fur business.

This is just a hint as to what it is all about. The first installment will appear in an early issue.

ward the path that led to the foot-bridge at the bottom of the hill.

"Why, whatever in the world ails Jack?" gasped Jill. Then, after a startled pause, she asked: "David, do folks ever go crazy for joy? Yesterday, you see, Jack got two splendid pieces of news. One was from his doctor. He was examined, and he's fine, the doctor says; all well, so he can go back now, any time, to the city and work. I shall go to school then, you know,—a young ladies' school," she finished, a little importantly.

"He's well? How splendid! But what was the other news? You said there were two; only it couldn't have been nicer than that was; to be well—all well!"

"The other? Well, that was only that his old place in the city was waiting for him. He was with a firm of big lawyers, you know, and of course it is nice to have a place all waiting. But I can't see anything in those things to make him act like this, now. Can you?"

"Why, yes, maybe," declared David. "He's found his work—don't you see?—out in the world, and he's going to do it. I know how I'd feel if I had found mine that father told me of! Only what I can't understand is, if Mr. Jack knew all this yesterday, why didn't he act like this then, instead of waiting till today?"

"I wonder," said Jill.

CHAPTER XXV THE BEAUTIFUL WORLD

DAVID found many new songs in his violin those early winter days, and they were very beautiful ones. To begin with, there were all the kindly looks and dees that were showered upon him from every side. There was the first snowstorm, too, with the feathery flakes turning all the world to fairy whiteness. This song David played to Mr. Streeter, one day, and great was his disappointment that the man could not seem to understand what the song said.

"But don't you see?" pleaded David. "I'm telling you that it's your pear-tree blossoms come back to say how glad they are that you didn't kill them that day."

"Pear-tree blossoms—come back!" ejaculated the old man. "Well, no, I

can't see. Where's yer pear-tree blossoms?"

"Why, there—out of the window—everywhere," urged the boy.

"There! By ginger! boy—ye don't mean—ye *can't* mean the snow!"

"Of course I do! Now, can't you see it? Why, the whole tree was just a great big cloud of snowflakes. Don't you remember? Well, now it's gone away and got a whole lot more trees, and all the little white petals have come dancing down to celebrate, and to tell you they sure are coming back next year."

"Well, by ginger!" exclaimed the man again. Then, suddenly, he threw back his head with a hearty laugh. David did not quite like the laugh, neither did he care for the five-cent piece that the man thrust into his fin-

gers a little later; though—had David but known it—both the laugh and the five-cent piece gift were—for the uncomprehending man who gave them—white milestones along an unfamiliar way.

It was soon after this that there came to David the great surprise—his beloved Lady of the Roses and his no less beloved Mr. Jack were to be married at the beginning of the New Year. So very surprised, indeed, was David at this, that even his violin was mute, and had nothing, at first, to say about it. But to Mr. Jack, as man to man, David said one day:—

"I thought men, when they married women, went courting. In story-books they do. And you—you hardly ever said a word to my beautiful Lady of the Roses; and you spoke once—long ago—as if you scarcely remembered her at all. Now, what do you mean by that?"

And Mr. Jack laughed, but he grew red, too,—and then he told it all,—that it was just the story of "The Princess and the Pauper," and that he, David, had been the one, as it happened, to do part of their courting for them.

And how David had laughed then, and how he had fairly hugged himself for joy! And when next he had picked up his violin, what a beautiful, beautiful song he had found about it in the vibrant strings!

It was this same song, as it chanced that he was playing in his room that Saturday afternoon when the letter from Simeon Holly's long-lost son John came to the Holly farmhouse.

Downstairs in the kitchen, Simeon Holly stood, with the letter in his hand.

"Ellen, we've got a letter from—John," he said. That Simeon Holly spoke of it at all showed how very far along his unfamiliar way he had come since the last letter from John had arrived.

"From—John? Oh, Simeon! From John?"

"Yes."

Simeon sat down and tried to hide the shaking of his hand as he ran the point of his knife under the flap of the envelope. "We'll see what—he says." And to hear him, one might have thought that letters from John were everyday occurrences.

DEAR FATHER: Twice before I have

written (ran the letter), and received no answer. But I'm going to make one more effort for forgiveness. May I not come to you this Christmas? I have a little boy of my own now, and my heart aches for you. I know how I should feel, should he, in years to come, do as I did.

I'll not deceive you—I have not given up my art. You told me once to choose between you and it—and I chose, I suppose; at least, I ran away. Yet in the face of all that, I ask you again, may I not come to you at Christmas? I want you, father, and I want mother. And I want you to see my boy.

"Well?" said Simeon Holly, trying to speak with a steady coldness that would not show how deeply moved he was. "Well, Ellen?"

"Yes, Simeon, yes!" choked his wife, a world of mother-love and longing in her pleading eyes and voice. "Yes—you'll let it be—'Yes'!"

"Uncle Simeon, Aunt Ellen," called David, clattering down the stairs from his room, "I've found such a beautiful song in my violin, and I'm going to play it over and over so as to be sure and remember it for father—for it is a beautiful world, Uncle Simeon, isn't it? Now, listen!"

And Simeon Holly listened—but it was not the violin that he heard. It was the voice of a little curly-headed boy out of the past.

When David stopped playing some time later, only the woman sat watching him—the man was over at his desk, pen in hand.

John, John's wife, and John's boy came the day before Christmas, and great was the excitement in the Holly farmhouse. John was found to be big, strong, and bronzed with the outdoor life of many a sketching trip—a son to be proud of, and to be leaned upon in one's old age. Mrs. John, according to Perry Larson, was "the slickest little woman goin'." According to John's mother, she was an almost unbelievable incarnation of a long-dreamed-of long-despaired-of daughter—sweet, lovable, and charmingly beautiful. Little John—little John was himself; and he could not have been more had he been an angel-cherub straight from heaven—which, in fact, he was, in his dotting grandparents' eyes.

John Holly had been at his old home less than four hours when he chanced upon David's violin. He was with his father and mother at the time. There was no one else in the room. With a sidelong glance at his parents, he picked up the instrument—John Holly had not forgotten his own youth. His violin-playing in the old days had not been welcome, he remembered.

"A fiddle! Who plays?" he asked.

"David."

"Oh, the boy. You say you—took him in? By the way, what an odd little shaver he is! Never did I see a boy like him."

Simeon Holly's head came up almost aggressively.

"David is a good boy—a very good boy, indeed, John. We think a great deal of him."

John Holly laughed lightly, yet his brow carried a puzzled frown. Two things John Holly had not been able thus far to understand: an indefinable change in his father, and the position of the boy, David, in the household—John Holly was still remembering his own repressed youth.

"Hm-m," he murmured, softly picking the strings, then drawing across them a tentative bow. "I've a fiddle at home that I play sometimes. Do you mind if I—tune her up?"

A flicker of something that was very near to humor flashed from his father's eyes.

"Oh, no. We are used to that—now."

(Continued on Page 18)

What Are You Worth?—By A. E. Wilkinson

ONE day while reading I noticed a statement which interested me very much. The title of this statement was "What You're Worth." It stated that according to scientific investigation, the ingredients of man are as follows:

Fat enough for seven bars of soap.
Iron enough for a medium-sized nail.
Sugar enough to fill one shaker.
Lime enough to whitewash a chicken coup.
Phosphorus enough to make 2,200 match tips.
Magnesium enough for a dose of magnesia.
Potassium enough to explode a toy cannon.
Whatever else you are worth depends upon what you make of your time.

Analyzing this somewhat I have wondered if the fat mentioned is entirely in one's head; or if the iron really does give an iron constitution. Probably the sugar mentioned varies in some people and is undoubtedly more abundant in the female than in the male, although occasionally one finds a vinegary female. There must be more lime in the Caucasian race because undoubtedly this causes them to be called a pale face. I can't understand why so much phosphorus is found in a man or why he should need 2,200 matches—one match is generally enough or at least all most of us can stand. The magnesium may be increased by recourse to the drug store, and the potassium in some fathers evidently accounts for why father raises the roof at times.

Using Time

The greatest point of all is in the last sentence; that is, "what use you make of your time". Analyzing this carefully, what percent of your time is used in thinking? What percent in dreaming? What percent in sleeping? What percent in playing? And last but not least, what percent in working?

In *Thinking*, what? That you should be somewhere else such as in Europe, Florida, California, etc.; anywhere that the grass appears to be greener? Thinking that you should be rich?—few are very rich. Thinking that you are jealous of your successful neighbor?—such thinking may be a spur to your doing. Thinking that you are poor?—there are some that are money poor; there are more that are thought poor. Thinking that you have had hard luck?—hard luck is mostly poor thinking aided by poor management. Thinking self-pity?—this is self-destruction. Or, do you think on worthwhile subjects and real problems such as how to live better, a better home, better equipment, better clothes, and more better friends, or how to farm better with improved tools, profitable crops, excellent plans, or how to render greater service to the community, to the nation and to yourself? Correct thinking means education or advancement.

In *Dreaming*, what? That you are somebody beyond your reach; that you are something impossible?—both of these are air castles. Dreaming of the past and its mistakes, follies and failures?—if so, don't dwell here long. Dreaming of the present and what it is?—this is a real facing of the facts. Dreaming of the future and its bigness and hitching yourself to a star? Dreaming of just nothing, or, are you dreaming of constructive things that you can really do or reach? Dreams that have a chance to come true such as more friends and how to get them; more successful business and how to get it; a better home and the many details of home life; better stock; better equipment; better clubs and a wide variety of other things? Dreaming means desire. It is the spur for greater things.

Dreaming

In *Sleeping*, what? Is this your principal occupation, even with your eyes open, or do you *rest* in sleep, thus rendering yourself more valuable for tomorrow's job? Sleepy ones are also called "dead" ones and according to the small boy in the Sunday School class "dead ones are those that go to —. Let's not be dead ones but let us

be full of life, active, energetic, smiling, thoughtful and happy. Sleep then means rest.

In *Playing*, what? Do you play too hard? This is injurious to most of us. Do you play too soft? It is equally injurious. Do you really take time to play? Play should mean to relax. This then means to see what the other fellow is doing; to see how he does it; to entertain; to be neighborly. It may also mean to go to church, to musicals, to the theatre, to movies, to lodges and to clubs. Or, it may mean to listen to the radio; to attend sports such as football, baseball, basketball or other games. It also means to take part in

printed by other papers, among them being the home of Harriet Beecher Stowe, Brunswick, Maine; Birthplace of Dwight L. Moody, Northfield, Mass., and old St. Paul's Chapel, oldest church edifice of New York City, where our first president attended services after his inauguration. It is very interesting to me to make these collections, and then in my reading as I come across any reference to any of these places, I can add personal notes on the margin. This helps to connect individuals, buildings and States, and fix them in the memory.

I have been interested in looking up the birth states of the authors of our

table growing are covered, from the time the seed is planted, with varieties recommended, until the time the crop is harvested and marketed to the best advantage. A very useful addition to any vegetable grower's library.

* * *

"THE PURPLE SEA" by Frank Owen has been described as "more splashes of Chinese color." It is a medium-sized book full of odd stories about the Orient, fanciful, mysterious. Swinging, colorful lanterns, breath of rich perfume, desert heat and tinkle of camel's bell lend atmosphere to these strange, interesting tales. Lantern Press, \$1.50.

tennis, golf or any games that are health giving. It may include traveling or visiting. Play undoubtedly means recreation and recreation means up-building.

In *Working*, what? Are you just a brute strength worker? Are you just a think-about-it worker—not a doer? Are you a money chaser or the reverse, or, are you a real systematic, plan-making worker? Are you combination brain and muscle worker? Does your work produce results? Working is our salvation.

It is a combination of the best of these that shows "whatever else you are worth".

Preserving the "Old Song" Stories

AS the stories of the Old Songs were started in the Summer, the farm-wife's busiest season, I did not have time to give them much consideration, so laid the papers aside until I could read them more carefully and preserve them for future reference. Procuring some paper of the local printer and having it cut about typewriter size, I have pasted the picture on a sheet of this paper, and on the reverse side pasted the descriptive matter. This required three extra copies, which I was fortunate to secure from publisher at so late a date, as some of the stories began on the second page. These sheets were then punched for a loose-leaf binder with a tally punch. This is a very convenient and quite necessary tool for making the perforations—from 18c up of Mail Order houses.

The "Shrines of America" I am saving in the same way, except that these require only a narrow strip of paper along the binder edge for reinforcement. I back two pictures together, as the text is all on the picture side, with a strip of paper about an inch wide between the sheets on binder edge.

I am collecting some homes of Authors and also some Church pictures,

Old Songs, and was gratified to find that New York could claim John Howard Payne, the writer of our beautiful "Home, Sweet Home." I did not however, find any from my native State of Conn. Ohio stands first in numbers, claiming two of the poets. Massachusetts, Maryland, Pennsylvania, Indiana, Wisconsin and one country across the sea, are represented.

The loose-leaf binder has many advantages over the old style scrap book, one important one being the chance to remove or add leaves as desired and keep subjects together. For instance, some two years ago I started my first binder with a picture of the Old Unitarian Church at Concord, Mass. And now among the "Shrines of America" is the picture of Concord Bridge and the Statue which will find its proper place next to the old church.

Our local stores carry only one size of binder, for student's use mostly, but when in the city recently I found a good assortment of shapes and sizes, ranging from ten cents to \$2.00 and \$3.00. Some were narrow, a little wider than a newspaper column, just right for clippings and cheap enough so one can have several—for Household Helps, Poultry Items, Poetry, Recipes, etc.

This is a beginning of my appreciation of the "Old Song Stories", for the end is not yet. They are easy to refer to and I shall take pride in showing them to my friends.—Edith B. Hover.

VEGETABLE CROPS by Homer C. Thompson, New York State College of Agriculture. McGraw-Hill Book Co., Inc., 500 pages with illustrations. Price \$5.00.

We have just finished reading Vegetable Crops and find that it contains very many valuable ideas for the vegetable grower and others interested in vegetables on a large or small scale. The field is covered very completely and an index enables one to find what he wants, easily. All phases of vege-

When Writing Advertisers, Be Sure to Mention American Agriculturist

We Prefer to Warn You

I am enclosing an express receipt on a crate of rabbits for which I have not received pay. If you will collect this amount for me I will be more than glad to subscribe to your paper.

WE frequently get letters similar to the one above. It is, of course, obvious that the American Agriculturist Service Bureau is maintained at considerable cost to us for the service of our subscribers. However, time and time again, we have stepped in to help someone who is not a subscriber and who has been referred to us by friends.

We replied to the writer of the above letter that had he been taking American Agriculturist he undoubtedly would not have shipped his stuff to the firm that he did. On at least two occasions during the last year we have had occasion to comment unfavorably on this concern. At the present time we doubt whether we will be able to collect the money even should we attempt to do so. The firm is not licensed and bonded and is not a commission company.

We are always more than glad to give our subscribers information about any buyer of farm produce if they will write us before they ship stuff to them.

Who Carries Insurance?

A subscriber writes "We have had considerable discussion about the insurance law in regard to the cutting of timber. If a man gives you one-half of it for cutting and hauling, does the man that owns the timber pay the insurance or does the man that is doing the cutting?"

I SHOULD say that the man who actually cuts the wood and hires men to do it is the one that is held liable for the insurance. The owner is not held liable unless he becomes an actual employer. Neither one would be held liable if the wood was not sold off the place.

Big Liabilities—Few Assets

SOME time ago we mentioned in the columns of American Agriculturist that the People's Home Journal had discontinued publication. Evidently many of our readers did not see this notice because we have since received quite a number of letters asking the same question. We have just learned that the total indebtedness of the company publishing this magazine is approximately \$260,000 and that the assets are less than \$30,000. This would indicate that holders of stock will get practically nothing for their investment and that those who subscribed to the magazine and whose term was unexpired will probably be unable to obtain anything for their money.

Prompt Action Saves Money

WE recently had many inquiries as to the reliability of the Kiddie Romper Co., which was sending out a great deal of publicity material from Cleveland, Ohio. In each case, we advised our readers not to send any money until we could furnish them with a report. The report which came states that Mr. Louis Harris, who claimed to be sole owner of this "home work" enterprise, was taken to jail for further investigation after the Better Business Bureau investigated and submitted their findings to the police. The Federal authorities charge him with using the mails to defraud. He waived preliminary examination and is at present in jail, unable to furnish the \$5,000 bond imposed, awaiting action of the Grand Jury.

A tremendous volume of mail had accumulated at the post office in answer to his advertising of the Kiddie Romper Company. Most of these pieces of mail undoubtedly contained a considerable number of \$2.00 check orders and currency. The post office requested Mr. Harris to sign an order

authorizing them to return all this mail to the senders. Between the dates of February 26 and March 6, more than 1500 such remittances had been received. This is just one more illustration of the reason why American Agriculturist constantly advises its readers against answering any home work advertising.

Increase your supply of fall blooms by planting Stoke's aster, which has large blue and white flowers from June until late October.

Right, AGRICO WINS IN TEST. Mr. Walter E. Davis, of Hunt, Livingston Co., N. Y., displaying potatoes grown with AGRICO. He tested AGRICO with another fertilizer costing \$9 more per ton. AGRICO produced a better crop. Mr. Davis writes: "Had I used all AGRICO I would have saved \$31.50." (Nov. 10, 1930).

Below, \$44.85 EXTRA PROFIT PER ACRE. Because AGRICO increased his yield an average of 13 bu. per acre, Mr. L. H. McCarty, shown here in his bean field at Houghton, Allegheny Co., N. Y., figures that AGRICO put an extra profit of \$44.85 per acre into his pocket. His beans yielded nearly double the local average.

AGRICO Cost \$9 Less Per Ton ... Produced a Better Crop

Above, 15 TONS OF CABBAGE PER ACRE. Mr. Carl Willig (at left) and his son, Lewis, displaying some of the cabbage grown with "AA QUALITY" Fertilizer last season on their farm at East Rochester, Monroe Co., N. Y. Mr. Willig writes: "I do believe your Fertilizer should have the credit for the splendid crop I harvested." (Oct. 29, 1930).

Right, CORN 15 FT. 10 IN. HIGH. Here is the junior partner of Fred D. Vernon & Son, LaGrangeville, Dutchess Co., N. Y., measuring his own not inconsiderable height against a typical corn stalk from their 1930 crop. AGRICO gave them 130 tons of ensilage from 4½ acres. Mr. Vernon writes: "\$4.75 per acre for AGRICO enabled us to get 2½ times the average yield for this district." (Oct. 3, 1930).

HERE are facts about a fertilizer test made by Mr. Walter Davis, of Hunt, Livingston Co., N. Y.:

"This year I made a fertilizer test using another brand of fertilizer on one plot and an equal amount of your AGRICO-for-Potatoes on another plot. Throughout the growing season I could see very little difference in the two plots, with the exception that the AGRICO plot did not show the effect of the dry, burning weather as much as the other did, for we had but one slight shower during the growing season.

"When we dug these potatoes we kept a careful check on each plot and found that the potatoes grown with AGRICO were of better size and quality, showing also a slightly larger yield. Here is the important point:

"The other fertilizer was of higher analysis and cost \$9.00 per ton more than AGRICO; so that, had I used only AGRICO, I would have saved \$31.50 on fertilizer, besides getting a slightly larger yield during an unusually dry season and a better-quality crop." Walter E. Davis, Nov. 10, 1930.

How Profits are Increased

Thousands of other farmers in this and adjacent states use AGRICO to give them

larger yields, lower costs and bigger net profits.

By increasing your yields from each acre, AGRICO reduces the cost of growing each bushel and this in turn increases the margin of profit. A farmer cannot increase the market price, but he can reduce his costs—and that amounts to the same thing. *Know your costs, don't guess.* We have made it easy by providing a new crop-cost method, so simple anybody can use it. Ask your dealer for a copy—or fill out the coupon below.

Don't skimp on fertilizer; for when all is said and done, it's the crop-producing power of the fertilizer you use that measures the size of your profit. Use the best fertilizer you can obtain, and use enough of it. Don't expect so-called "cheap" goods to give you the profits you want and the profits your hard work entitles you to.

The extra care with which AGRICO is made, the extra plant-food values which it contains—these are the factors responsible for the extra profit farmers obtain with AGRICO. There is a brand of AGRICO for every crop. See your nearest "AA QUALITY" Fertilizer dealer and place your order now—or send the convenient coupon today.

Top picture shows line of trenches at Yorktown as they are today. Below, monument marking spot where Cornwallis surrendered. Lower right, house where papers of capitulation were drawn up.

SHRINES OF AMERICA

Yorktown

THREE years of intermittent conflict and retreat, march and countermarch, north and south; Washington and the British played hide and seek. The summer of 1781 found Cornwallis in Yorktown, Virginia; Washington in New York. Washington, the quicker witted, saw his chance, with the aid of French allies, to bottle Cornwallis. Feigning activity in New York he moved his army quietly to Virginia, joined LaFayette, laid siege to Yorktown. Two months of trench warfare and on October 19, 1781, Cornwallis's army marched out, laid down their arms, surrendered. The Revolutionary War was over. American independence was won.

Use a Ford Truck this spring

To haul your products to market—to bring supplies back home

LET a Ford truck help you prepare for planting-time . . . bring new machinery out from town . . . haul seed, and feed, and supplies. It can do all of your hauling throughout the year, lending its power and strength to each task. It will work for you many seasons, at low cost, returning value far in excess of its price.

Ford trucks are strongly built, of fine materials, and to strictest standards of excellence in design and workmanship.

For example, more than twenty ball and roller bearings are used at important chassis-points. These serve to reduce friction and wear, to make driving easier and operation smoother, and to prolong the life of the truck.

Other features are the use of forty different kinds of steel for specific purposes,

and the extensive use of fine steel forgings. Simplicity is embodied in every part of the mechanism.

All of these help to increase the reliability, strength, economy, and value offered by Ford trucks . . . assuring long service at a minimum cost of operation and maintenance.

The chassis is available with 131½-inch or 157-inch wheelbase. Equipment which all Ford dealers can supply includes stake sides and cattle-racks, for use on the standard platform body. They may be equipped with either open or closed cabs. Dual rear wheels are available at small additional cost, and there is a choice of high or low rear-axle gear-ratios.

See these trucks at your Ford dealer's. They are low in cost, as a result of Ford manufacturing policy and large production.

FEATURES

of Ford Commercial Units

Four-cylinder, 40-horse-power engine. Torque-tube drive. Internal-expanding mechanical brakes, all fully enclosed. Forty different kinds of steel for specific purposes. Extensive use of fine steel forgings. More than 20 ball and roller bearings. Three different wheelbases. Two different chassis. Triplex shatter-proof windshields. Low first cost. Low cost of operation and maintenance. Reliability and long life. You may purchase a Ford truck or light commercial car on convenient, economical terms through the Authorized Ford Finance Plans of the Universal Credit Company.

Is the Pasture a Crop?

Grass is Still the Cheapest Feed For Dairy Cows

DAIRYMEN in the East have recognized for years that their pastures have steadily been growing poorer. Putting it baldly, this is the result of a steady decrease in fertility caused by grazing year after year without putting anything back on the land. Because of this and also because of increasing acidity, areas that once grew Kentucky blue grass and white clover finally came to the point where cows are trying to get a precarious living from paint brush, ferns, and moss.

For the past ten or fifteen years, State Colleges, Experiment Stations, and fertilizer companies have been studying the problem and now have some very definite recommendations. Just as a start, suppose we decide to fence the cattle out of the woodlot. Aside from the fact that they travel a good many miles without getting much feed, the cows are not harmed by running in woodlots. In this case, it is the woodlot that suffers because it is practically impossible for any young trees to get a start. In addition to fencing off the woodlot, there are thousands of acres of pasture which in the long run will be more profitable if fenced away from the cows and reforested.

At the same time, for all practical purposes the pasture area can be enlarged by cutting down or pulling out thorn apple trees or brush. Then if more pasture is needed some fields which have been cultivated, perhaps without much profit, can be included. The whole tendency is toward more fertile pasture either through improving the present pasture area or by reforesting the poorest and add-

ing better land. Another recommendation that on some farms can be followed without much cost, is to divide the pasture into several areas and pasture them in rotation. Many farms already have two pasture lots. Where cattle have the free run of all the pastures they naturally graze the more fertile sections very closely because the grass there is more palatable and as a result, the poorer grasses get so big that they absolutely refuse to eat them. Rotating the pasture compels them to graze more uniformly and at the same time, pastures which are not being grazed are given a rest and allowed to get a good start. Another advantage of this system is that it distributes the droppings of the animals more uniformly. Where they have the run

of the entire pasture and graze the best portions closely, these areas which are already most fertile, get the major portion of the droppings and their fertility is increased, while the poor areas become steadily poorer.

Thousands of acres of pasture need lime. A large proportion of this area is so hilly or so far removed from the road that the addition of lime is a costly process. The question as to whether or not it will pay to add lime is a problem that each dairyman must solve for himself. While lime gives best results when harrowed into the soil, satisfactory results can be obtained by top dressing. Where it is not profitable to add lime, dairymen must be satisfied with poorer variety of grasses because Kentucky blue grass and white clover, generally considered to be the best pasture plants, will not grow without lime.

On many farms manure is commonly added to the pasture. In fact, some dairymen feel that this is one of the most profitable uses they can make of farm manure. Wherever possible, a light application is made with the spreader and usually this manure is re-enforced by the use of super-phosphate. This should always be done because authorities generally agree that phosphorus is the backbone of any pasture fertilization plan. The manure does two things; first, it adds fertility, and second, for the first year it discourages too close grazing and gives the grass a chance to start. Many farmers, however, believe that

(Continued on Page 8)

This is not a picture of some cows turned into a meadow. These are cows in a heavily fertilized pasture in Bavaria. It is stocked so heavily that it will be grazed down in a week or ten days and then the cows will be turned into a similar field. This intensive system requires expert management in order to be successful.

Better Lawns for Small Towns

Some New Ideas That Can Also Be Used on the Farm

By UTHAI VINCENT WILCOX

PERHAPS you know how it is.

When the new house is finished, all about the back yard and perhaps in the front yard too the ground lies as barren as a desert. Perhaps it is littered with rusty nails and plaster and covered with ragweed and pepper grass. The former top soil is well covered over with the clay that has come from the region that is now the basement.

Yet there are the visions of rose-covered arbors, a spacious lawn, vivid and green needed to set off the new home. But for some reason or other the rose bushes die, and seeds of annuals and perennials send only spindly growth through the bricklike soil, and the grass burns up or washes away. It is not hard to guess the trouble.

"No top soil," the neighbors say, "nothing for the plants and the grass to live on. You need humus from the woods or compost from a barn yard."

It all sounds hopeless and complicated. It sounds like a lot of money, effort, and worry. But listen, the problem has been largely solved by the scientists of the Bureau of Soils and Chemistry of the Department of Agriculture, who in their search for concentrated and powerful fertilizers for the farmer, have experimented in their own yards. They have found that the powerful stimulants which they have concocted are adapted almost ideally for the small village or country garden and lawn.

Dr. J. W. Turrentine is a member of the staff of the Fixed Nitrogen Research Laboratory of the Department of Agriculture. Moreover he had the problem of the poor soil put up to him when he moved into a new home.

Now, Dr. Turrentine knows a good deal about soils, and as soon as he had sunk his spade into the ground he knew that he was face to face with a difficult problem. It was about the poorest soil possible. The contractor, in building the houses on the street, had cut down the grade eight feet, so that none of the topsoil, which would have contained considerable organic material, was left. The sub-soil had almost nothing in it on which the plants could feed.

Friends with previous experience were liberal with advice. Some told him to have four or five inches of this soil removed and rich dirt from the country hauled in to take its place. This might have cost him a considerable sum of money. Others told him that it would be necessary to spade up the soil for two or three feet and mix it thoroughly with organic matter before he could hope to grow good flowers, or even grass. All this was hard and costly.

Dr. Turrentine decided to follow none of this advice. He had assisted in compounding some of the concentrated fertilizers and decided that here was a good chance to "try them on the dog." They would either ruin his garden or make it.

So late in March he went out with an ordinary flower sprinkling pot and sprinkled over the soil, very lightly, some solutions of these fertilizers. He repeated this process once a month for the rest of the Summer. The problem was solved. There was no ill-smelling stuff to handle, no hard work of hoeing and spading in, no heavy bills for fertilizers. Then, the annual garden inspection

Vol. 127 April 4, 1931 No. 14

Unwise Regulation

"Just recently the inspector for the Newark, New Jersey Department of Health came to my place and informed me that he could not pass my barn because the horses were not partitioned off from the cow stable. I asked him why a partition would make any better milk. He was unable to do this."

WE might add that no one else is able to give a practical reason. Hundreds of farmers keep their horses in part of the dairy barn without partitions between without its affecting the quality of milk. However, the regulation was adopted by the Department of Health of Newark, New Jersey last summer. A strong protest was made by the dairy industry, but to no avail, so there is nothing to do but comply.

This publication is in thorough sympathy with the efforts of the dairy industry and the health authorities to improve the quality of milk and we believe that no effort should be spared on the part of the farmers themselves to produce high quality milk, not only from a health standpoint but because better milk leads to more consumption. But sometimes it has been difficult to get the farmers to cooperate in carrying out good measures because they have been forced to comply with impractical regulations that they well know have no bearing whatever upon the quality of milk, but do increase the cost of production.

How the Tariff Helps (?) Maple Syrup Producers

HERE is how the new tariff law protects (?) maple syrup and sugar producers.

Congress materially raised the tariff on imported maple syrup and sugar, most of which comes from Canada. The Canadians, in order to avoid paying the higher duty increased their imports tremendously before the duty went into effect, thus completely swamping our American markets. Then pressure was brought on the United States Tariff Commission to reduce the duty on maple sugar and syrup and the Commission changed it back to the old rate! Here is how it works out in actual figures.

In recent years, until June 17, 1930, the rate of duty on maple sugar was four cents per pound and the duty on syrup approximately forty-four cents a gallon. The new Smoot-Hawley tariff law raised the rate to eight cents on sugar and approximately sixty cents on a gallon of syrup. The importation of maple sugar from Canada has rapidly increased in recent years. During the year 1929, apparently in anticipation of the increased tariff, importation of sugar from Canada

nearly doubled, equalling more than twelve million pounds, with one million, five hundred thousand pounds of maple syrup imported.

As a result of these great importations, our own products in the hands of the dealers could not be moved, and our producers are faced, during this season, with a market at ruinous prices. In spite of this, however, as stated above, the Tariff Commission has recently announced that it has restored the rate back to four cents a pound on sugar and forty-four cents per gallon on syrup.

No government act in some time has made us more indignant than this rank injustice on the part of the Government against its own people. It makes one a little tired of the constant talk about farm relief, mostly impractical theories, while in actual practice the Federal Government pulls stunts like this maple sugar tariff business.

Unfair Oil and Gas Leases

WE are still receiving a good many letters about gas and oil leases. While many of these have improved since the AMERICAN AGRICULTURIST began to point out their unfairness, there are still many leases being offered to farmers that are decidedly unfair.

As we have said many times, the only right way for a gas and oil company to do is to give the farmer the same share of any gas discovered, as is offered for oil—that is, one-eighth. If this is not offered, then certainly the company should pay a rental of at least \$250. Some of them are offering as low as \$50 per well. Three hundred dollars is better and some companies are offering it.

We would not sign a lease of this kind. But if you have signed a poor lease, our suggestion is to let the matter rest unless there is some drilling operation started in your neighborhood or proposed for your farm. In that case, we would take the lease to a good local lawyer and abide by his advice.

Too Many Jury Exemptions

"I see by the papers that the exemptions from jury duty are up before the Legislature again this year. So many exemptions make it hard for the farmer, particularly in townships where there are incorporated villages. A large percent of the eligible jurymen in the villages belong to the volunteer fire companies and so are exempt from all jury duty forevermore. This makes double the jury duty for many farmers.

"It seems, too, that there is an unnecessarily large list of exemptions among the professions and trades in these rural communities."—F.M.A.

HERE is something to think about. It so happens that we ourselves never served on a jury in our lives. We would be glad to but have never been called on. There are thousands of other citizens willing to do their duty as jurymen but are exempt for one reason or another, and then there are too many others, also, who beg off with poor excuses. Any legislation at Albany, or anywhere else, that increases exemptions from jury duty should be defeated. Instead, many of the exemptions themselves should be repealed.

Bet You Have Forgotten the Taste of Good Syrup

ALL through the hard maple country, maple syrup and sugar were the only sweets that the pioneers had. Those who know and love these pure, natural products, firmly believe that they are better for the health than any bitters or tonics that the doctor can prescribe for that run-down feeling in the spring.

We have regretted the passing of so many of the maple groves. We have regretted the adulteration of fine maple products to the point where it is difficult to get real maple syrup on the city breakfast table, or in the hotels or restaurants. But it still can be had and we wish we might see a revival of the demand for good maple products, not only among city people, but among

those farmers who have almost forgotten how good syrup tastes. Where is the old-time attitude towards these splendid products? Why not plan to lay in a few gallons of syrup and a supply of maple sugar during the coming season?

Changing Attitude Toward Regulation

BERNE A. PYRKE, the competent Commissioner of New York State's Department of Agriculture and Markets, made an interesting comment the other day about the changing attitude of business towards regulations. There was a time when all business fought bitterly any proposed control whatever of their industry. Today, Commissioner Pyrke says, and we agree with him, that the attitude is changing.

To cite an example: There is at present a bill regulating the quality of ice cream before the New York State Legislature. Instead of opposing this bill, we are informed that many of the leading manufacturers are urging its passage, the reason being that they, themselves, are producing a very high quality cream and they want to force the irresponsible manufacturer to do the same. With strict regulations, there will not be a lot of poor stuff on the market.

"Now, farmers may come to some such attitude in agriculture. We do not believe much in trying to force anybody to do anything, but some day, farmers may have to find a way to take care of the irresponsible producer who insists on ruining the market with unorganized products, often of exceedingly poor quality.

For a Tariff on Dried Eggs

OUR friend, John E. Pickett, editor of the Pacific Rural Press, writes as follows from California:

"We are forwarding more than 5,000 signed petitions to President Hoover, urging an increased tariff on dried eggs. This matter is now pending before the Tariff Commission and the President. It would seem that if the poultrymen unite in asking, they have a good chance to get the proposed increase. It seems fair to say that the flood of Chinese eggs is largely responsible for the present low prices of eggs, because the imports rushed in ahead of the new tariff were just about equivalent to the home surplus of production—thus doubling it."

Mr. Pickett has made the situation very plain. He is right. The question is, "What do you poultrymen want to do about it?" A letter or telegram to President Hoover would do some good, particularly if there are enough of you who think enough of your business to be willing to take the time to write or wire.

Time For Renting Farms

THIS is the season when farms are rented, and we are getting a number of requests as to the right kind of lease between landlord and tenant. We cannot answer this question specifically, because the forms of leases vary according to the customs of a community, and what is fair in one place often will not work somewhere else.

Two or three principles may be laid down, however. The first and most important is mutual respect between landlord and tenant. If both men know and like each other, there will be little trouble over the terms of the lease. It should go without saying, also, that all the terms should be in writing and it is good to spend a little money for a lawyer's fee in putting the lease into proper form.

Eastman's Chestnut

THERE may be some husbands in the A. A. family who will not have to figure long to get the point of the following story:

Big, raw-boned, two-hundred pound Ma Jones won the contest down at the Grange picnic last fall for throwing a rolling pin the farthest and most accurately.

Little Pa Jones won the fifty-yard dash.

Some Old and Faithful Horses

It is difficult to feel any affection for a tractor. There is no question but that the numbers of them will increase or that under many farm conditions they are a profitable piece of machinery. The flood of letters and pictures that came into the A. A. office when we announced our Oldest Horse Contest convinced us anew that farm

has earned the staggering sum of \$21,000. Mr. Chauncey Evans, who is shown standing beside the team, has driven "Old Bill" continuously for twenty-five years through every kind of weather. Mr. Evans is known to thousands of people, both residents of Round Lake as well as many summer visitors who come to that town. First

also given the lighter parts of the farm work."

Something of the regard which an owner can feel for a horse is expressed in the following letter, written us by John J. Mettler of Hillsdale, New York, who wins the fourth prize:

"Here is an old horse. When I just think of her it makes tears come to my eyes; she was a wonder. We bought her at least thirty years ago. She was dapple gray, pretty as a picture, and was so spirited that she had to be driven with a J. I. C. bit. Everyone knew "Jennie," as we called her. We bought her from the American Ice Company in Flushing. We ran a milk dairy in Whitestone and Jen-

An old team belonging to Mr. Barnes of Deposit. The one at the right is still living and is thirty-seven years old.

Mr. Chauncey Evans of Round Lake, New York, with Old Bill, the gray horse.

families do feel a real affection for the horses that have served them so faithfully for many years.

You will remember that in the contest we specified that a photograph sufficiently good that it might be reproduced, must be included with each entry. Unfortunately, many of the pic-

W. E. Hurst of Wyoming County, and the horse he drove to school when he was a boy.

tures sent in were not clear enough to make it possible to reproduce them here.

"Old Bill" who lives at Round Lake, N. Y. is forty years old. Thirty-five years ago the superintendent of the village bought a team of gray horses for general teaming use in the village. At that time the team was four and five years old and were called "Nell" and "Bill." "Old Bill", the gray horse shown in the picture, has out-lived at least four team mates and is still going strong. It is claimed that "Old Bill" has never missed a meal nor been sick a day. Assuming that he has worked three hundred days for thirty-five years at 20c an hour, "Old Bill"

"Jenny" carrying two of the younger generation of Mettlers.

prize goes to Mr. Archie Cleveland of Round Lake, New York who sent us the picture.

William Thatcher of North Haven, Connecticut, sent us a picture of a horse who is in the family 31½ years. This horse was in the livery business ten years and then on a milk delivery wagon 24 years. As near as we can estimate, the horse was forty years old when he was killed. Mr. Thatcher wins the second prize.

Several pictures were sent us of horses thirty-nine years old. Some of them, unfortunately, could not be printed. Third prize goes to Miss Anna Bucknam of East Bethany, New York for the picture of a thirty-nine year

Billie, a trick horse owned by Eleanor Eagle of Ransomville, New York.

old horse, owned by Mr. W. E. Hurst of Wyoming, New York. Miss Bucknam writes as follows:

"I have read about a horse thirty-seven years old and the contest you are having to determine the oldest horses. I am sending you a picture of a horse and its owner. The horse was owned by W. E. Hurst of Wyoming and was born in May 1879. He was raised and lived on the farm of his owner and died in June 1917, being in his 39th year. The horse was driven back and forth by Mr. Hurst while he was attending Wyoming High School. After Mr. Hurst left school, the horse was used as a driving horse and was

This picture of a forty-year-old horse was sent by William Thatcher of North Haven, Connecticut.

nie used to take me to Brooklyn twice a week for milk. She made two trips to Fort Totten every day on the milk wagon and she was always ready to go; when the other horses were tired, Jennie was alert. I belonged to the Indian Volunteer Hose Fire Company in Whitestone and I took Jennie on the hose cart one day and after that as soon as the fire bell would ring Jennie would run right to the fire house no matter where I would have her on the route. We always said she would die in the harness and she almost did. We moved to Hillsdale on a farm and there Jennie did anything and everything. This last summer I cultivated corn with her and she seemed to lag. I took her to the stall and doctored her for colic but poor Jennie died. She was at least 38 or 39 years old and we all loved her."

"Billie" while not so old, at least judged by

Ruth Ballinger of Marlton, New Jersey, says that twenty years ago this was her father's "sparking" horse.

when they were not quite three years old. He and his brother had a hard time breaking them for they were very wild and mean to control. But when finally broken, he became a very kind, gentle, and good little horse in every way. His name is Billie. Billie and his mate both looked alike and was the main team for going to market, light work on the farm, and driving on the buggy. He is a splendid saddle horse and I ride him lots. He does lots of tricks for me, even now at his old age. He will kiss me, put his foot over a rope, kick for me, paw, kick up behind,

Prince, whose picture was sent us by Mrs. William Hamilton of Ludlowville, New York.

shake hands, go to sleep with his head on my shoulder, and rear up on his hind feet by just telling him to do it.

He is by all means the handiest horse on the farm for he is faithful, honest, and true in any spot or place you put him. He works right along side of a much larger horse than himself and stands it well. Billie is very kind to the dogs. He will let them ride on his back and lets them lead him around the yard. I hope you will think Billie deserving of a picture in your paper."

We have already said that it is difficult to show affection for a tractor. It may be a little easier to at least take some pride in an automobile, yet the

Some Developments in Spraying

THERE was a time years ago when good apples could be produced without spraying. Everyone realizes, of course, that that time is long since past. In fact, it appears that as time goes on it becomes necessary to spray with increasing care in order to produce a crop free from insect or disease injury. The West has a reputation of being more progressive and less hampered by tradition than the East and there may be something to this idea. At least, Western boxed apples have pretty nearly captured a large part of our Eastern eating apple trade.

For years there has been a constant development in materials and methods for spraying and during the past few years the advance has been particularly rapid. It is a long way from sprinkling an apple tree with a knapsack sprayer or even a power spray rig with low pressure to present methods which have reached their climax with the modern stationary spray rig where spray materials are mixed at a central point and piped under pressure to all parts of the orchard.

When to Apply

First, however, let us consider a development which is quite as important as spray materials or methods of application, namely, a plan which is generally spoken of as the "county spray service." Experts on insects and diseases can tell the grower to apply a certain spray at a certain period of development of the insect or disease, but the next thing is to apply this knowledge to actual conditions. The development of both insects and disease depends largely upon weather conditions. In general, of course, warm weather hastens them and cold weather delays them. Under the spray service plan an expert on disease and insects is located in a county and watches the development of insects and disease with great care. When conditions are right for application of a certain spray, this man calls one man in each community center, telling him that the spray should be put on and these men in turn call their neighbors and thus very quickly the news is spread throughout the entire county. Time and time again in the past, growers who did not have this service have reported that they sprayed for certain insects and diseases without any results. Almost invariably investigation has shown that whereas they applied it at the right calendar date, they did not apply it when the insect or disease had developed to just the right stage. This spray information service has saved fruit growers thousands of dollars.

For years there has been constant study and experimentation to develop new insecticides and fungicides. This work has been carried on by the State Experiment Stations of the Agricultural Colleges, and by firms who have manufactured these products. Some of the results secured have been more or less by accident. For example, the value of Bordeaux mixture in controlling diseases was discovered, not in this country, but in France where it was used to frighten passersby who were in the habit of picking and eating grapes. However, there have been and still are discoveries in this country which have added greatly to the effectiveness of your spray program. As just one example of this, is the recent discovery of the substance known as geraniol. It is very attractive to Japanese beetles and the use of it will cause them to congregate where they can be much more easily controlled by spray methods.

How to Apply

Just as important has been the development in methods of application. As a preventative of disease spray must cover the entire leaf surface and must be put on before the disease ac-

tually attacks the trees. There has been a constant development of machinery with which to put on spray material more evenly under high pressure, and do it much more rapidly. Dusters have been developed which can get through the orchards which may be too wet for the use of a heavy spray rig, and dust because it does away with the necessity of hauling water, can, in general, be applied with greater rapidity than spray. Recently, there has been another development tending toward greater rapidity of application, namely, a machine which breaks up liquid spray material into very fine particles by the use of a strong blast of air through a large pipe.

The stationary spray outfit already mentioned is the last word in labor saving and speed of application where there is a large area of trees. Last summer on the Hudson Valley fruit trip we saw one such outfit where pipes were laid on top of the ground and taken up after the spraying period was over. The advantages of such a system are that the men actually applying the spray can work steadily because it is not necessary to wait for the tank to be refilled. At the same time, work is not held up because the ground may be too soft to allow sprayers in the orchard. The disadvantages, of course, are the relatively high cost of initial installment.

Looking into the future for a moment, it seems certain that new insects and diseases will be introduced, while at the same time consumers will continue to demand a high quality product. As a result, apple growing is getting to be more and more of a specialized business. Even now government statisticians are dividing their statistics on apple growing into total production and commercial production. In many sections of New York State, orchards that were set out by our fathers and grandfathers are allowed to grow without any care or are rapidly being cut up into stove wood. Under such conditions it becomes essential that the man who is growing apples on a commercial scale should keep in constant touch with every new development of disease and insect control.

Omission of Even One Spray Is Costly

MOST fruit growers and potato growers should remember that omitting just one spray at the right time may upset the whole season's program. Last year a Virginia apple grower tried a little experiment and failed to use nicotine in his delayed dormant spray on a part of his orchard. Fifteen to twenty per cent of his crop on the unsprayed trees was injured. The omission of the pink spray, or delaying it until too late, caused apples to be 75 per cent scabby. The cost of this spray was only about 4 cents a bushel.

Strawberries for Maryland

What varieties of strawberries are recommended for commercial planting in Maryland?

THE answer to this question will depend to some extent on whether you are shipping by refrigerator car or by truck. Two varieties, Missionary and Klondike, both early, are recommended for shipping in refrigerator car. Two late varieties are Chesapeake and Gandy. The Chesapeake does best in a dark, sandy soil while the Klondike is rather a shy bearer.

Varities recommended for shipping by truck are, Premier, Hefflin, Campbell Early, Big Joe and Lupton Late. The first three of these varieties are early and the last two are late.

APRIL

Strawberry Hints

THE strawberry crop that you will harvest this summer will depend primarily on the care you gave the crop last summer. However, there are a few things that you can still do. Just as soon as the danger of freezing is past and certainly before there is enough growth so that the leaves will turn yellow, rake off the mulch which we trust you put on last fall. Quite a lot of this straw or other material will have settled around the crowns and will help to keep the land moist and the berries clean.

The moisture supply from now until harvest will determine more than any other one factor the size of the crop you will pick. There is not much you can do about it now except that the home gardener who has running water can water the strawberry bed as it needs it.

You can undoubtedly help the crop, too, by applying some fertilizer just before blossoming time. On small home patches this can be applied by hand. There is some danger that commercial fertilizer will burn leaves but this trouble can be prevented by dragging a sack over the row to brush the fertilizer from the foliage.

Setting the New Patch

Weeds are the worst enemy of strawberries. One of the easiest ways to control weeds is to practice clean cultivation very thoroughly the year before the plants are set out, and then to cultivate very thoroughly a number of times before the plants are set this spring. Of course, no one with experience would set out plants on sod soil because of the danger of injury from white grubs.

One small point which is not always given sufficient attention is the vigor of the plants purchased. A plant with a big root system which gives evidence that it was grown in fertile land and with proper cultivation will produce you a much better crop next year than a small spindling plant. In fact, plants dug from an old neglected patch are practically valueless.

Another small point that needs attention is to set the plants in the proper depth. The crown should be on a level with the ground. If it is set higher than this the plant will dry out and will never grow properly, while if it is set so deep that the crown is covered with soil, results will be equally unsatisfactory.

The man who is setting out strawberries for the first time should be sure that he is setting out a variety that has perfect flowers, or if he is choosing some imperfect varieties that he set along with them some plants that have perfect flowers. Catalogs commonly mark perfect varieties with a "p" and imperfects with "imp." Flowers of the imperfect variety contain no pollen and naturally cannot produce fruit.

Varieties

The problem of what variety to plant is, of course, different for the home garden than it is to the commercial grower. Marshall is a variety especially recommended for the home garden. Other varieties frequently recommended are: Brandy-wine, which is especially good for canning; Excelsior, which is a very early variety; Senator Dunlap; Gandy, which does especially well on heavy soil; and Stevens Late Champion. The everbearing types are of interest to the home gardener. Two everbearing varieties recommended for New York State are Progressive and Superb.

There are, of course, many other excellent varieties. A complete list of recommended strawberry varieties can be obtained by writing to your State College of Agriculture, or if you prefer, we will be more than glad to get it for you.

Two cents a bushel now pays for seed potato treatment

UNTREATED TREATED

New dip increases yields

Now seed potato treatment will bring you more profit than ever before! *Improved Semesan Bel*—the new quick dip—has cut treating costs to the bone. Costs only 1½¢ to 3¢ per bushel of seed—one-fourth what it cost last year! And so quickly applied that one man alone can treat from 300 to 400 bushels of seed per day!

Dip, then Plant!

Say good-bye to "two-hour" soaking! Just dip your seed in *Improved Semesan Bel*—and plant. It protects seed pieces against rotting. It controls seed-borne scab and Rhizoctonia fully as well as formaldehyde and corrosive sublimate soak methods. And in time and labor, it costs you far less than either of these mussy, old-fashioned seed potato treatments!

Yields increased 13 to 20%
Sixty-two miles of test rows in 18

different states have proved that this new Semesan Bel is in every way a better seed treatment. Many tests by practical growers have resulted in yield increases ranging from 13% to 20%. One grower writes: "In 1930 we had the best yield we have ever had, and I lay it entirely to *Improved Semesan Bel*."

Treat certified seed

For full crop protection treat all seed with *Improved Semesan Bel*. One pound treats 70 to 80 bushels, for as little as 1½¢ per bushel. Even when purchased in very small quantities, its cost does not exceed 3¢ per bushel. Ask dealer for free pamphlet, or mail a post-card now to The Bayer-Semesan Company, Inc., Department 62, 105 Hudson St., New York, N. Y.

WHEAT IS NITRATE HUNGRY NOW!

TOP-DRESS IT WITH CHILEAN

Wheat at left fertilized with 200 lbs. Chilean Nitrate per acre—yield 33 bu. per acre. Wheat at right received no fertilizer—yield 19.2 bu. per acre. Top dressing with Chilean Nitrate often doubles the yield of wheat.

This is the time of year when you can do more for your wheat crop than at any other time. Top-dress it with Chilean Nitrate of Soda. This *natural* nitrate fertilizer supplies quick-acting nitrogen in its most efficient form just when the plants begin to grow and need the extra strength. It brings the crop through bad weather, then carries it through to a big yield of high protein wheat—the kind of yield that makes you real money.

Chilean Nitrate is the best investment you can make this year... makes so many extra bushels that you make a profit in spite of low prices.

It's NATURAL—that's why

Chilean is the natural nitrate, mined and refined in Chile by American capital and brought to our shores by American ships. Because of its natural origin it contains those so-called "impurities," Iodine, Boron, Magnesium, Potassium and Calcium, each of which is plant food in itself. Chilean is the super-nitrate because it is Nitrogen PLUS!

See your fertilizer dealer. Ask for Chilean and insist that you get Chilean. Two kinds... Original Chilean (Crystals) and Champion Brand (the pellet nitrate). Both are Chilean, packed in 100 lb. bags for your greater convenience and sold at a low price for your greater economy. Place your order now.

Crop Grower

Is the Pasture a Crop?

(Continued from Page 3)

manure can more profitably be used for the growth of cash crops.

When pasture improvement was first started some dairymen attempted to get results by plowing up areas that could be tilled, growing a crop for a year or two, seeding, and then turning it back into pasture. In general, the results were far from satisfactory and the reason for it is that good pasture grass will not grow on land that is not fairly fertile. In other words, increasing fertility is the first problem and usually when this is done the desirable pasture grasses come back even where no seed has been applied. Under certain conditions this plowing of part of your pasture may be good management, but always with the idea of adding lime where necessary and bringing up the fertility to the proper point. You can plow and seed a moss infested pasture, but unless something else is done too, it will still be moss infested shortly after it is turned into pasture again.

Two Schools of Thought

For all practical purposes when we speak about increasing the fertility of pasture land, we are restricted to farm manure or commercial fertilizer. About fifteen years ago, various agencies began to experiment with the use of fertilizers on pastures. In some sections, excellent results were secured by the use of superphosphate, then called acid phosphate, and lime. In fact, these two materials are still recognized as the basis of any improvement program. A little later work began to be done with complete fertilizers containing the three elements, nitrogen, phosphorus, and potash, and it is generally agreed that under proper conditions their use on pasture will be profitable. The only difference of opinion concerns the proper amount to apply. One group takes the position that relatively light applications of commercial fertilizer should be used on the entire pasture, or at least on the more fertile portions of it. This group also advises that before spending large amounts on fertilizer, some thought should be given to producing more feed either by including some meadow land in the pasture, or by growing some green crops to be cut and fed in the manger.

An Intensive Method

Others lean more toward the idea of taking first-class land, we might say the best that can be found on the farm, and fertilizing this area heavily. An amazing amount of feed can be grown on an acre in this way, but expert management is required to make the most effective use of it. This intensive type of pasture fertilization has been followed with considerable success in a number of European countries. Those who have studied this European system point out that it is always cheaper for a cow to go out and harvest her own grass than it is to cut it and feed her in the manger. Another advantage claimed is that the pasture season is lengthened considerably making less manger feeding necessary. Heavily fertilized areas can be pastured earlier, continue to give satisfactory grazing later in the summer, and recover earlier following fall rains.

The National Fertilizer Association, an organization of fertilizer manufacturers, has given considerable publicity to this intensive type of pasture improvement. Last spring Mr. John Abbott of the Association, went to Europe to make firsthand study of conditions there, and for the past two years the Association has fertilized experimental plots on a number of Eastern dairy farms. The Massachusetts Agricultural College has also done quite a bit of work along this line.

After following the whole field of

experimentation for a number of years, we have come to have a high regard for the type of work done by various commercial firms and of associations of such firms. The National Fertilizer Association has some experimental evidence to back up its recommendations and it is our opinion that neither they nor other commercial firms will knowingly recommend something which they do not believe is for the best interests of producers. Certainly on a long time basis, it would be foolish for them to follow such a practice.

Opinions Not Far Apart

After all, perhaps the opinions as to how much fertilizer to apply do not differ as widely as some seem to think. Just as an example, we quote the following from Professor E. L. Worthen of the New York State College of Agriculture: "The pasture practices for 1931 should be economically sound. While most permanent pastures can be made to produce more feed and the grazing season lengthened by fertilizing them, the immediate outlook for the dairy industry is not sufficiently bright to justify large cash expenditures for their improvement. The use of nitrogenous fertilizers, such as nitrate of soda and sulphate of ammonia, and of mixed complete fertilizers should be restricted largely to the more intensive types of dairying."

When Milk Is Needed

Although stated in different words and from a different angle, the following quotation from Mr. Abbott of the National Fertilizer Association, does not seem to be radically opposed to Professor Worthen's idea: "If a farmer has enough good grazing so that there is little or no occasion for manger feeding from mid-May until late September this certainly is no year for him to fertilize merely to make more milk; but if he is so short of good grazing as to have to do a good deal of manger feeding during the normal grazing season, then intensive fertilization of about one-third acre of good sod per milking cow in the herd will prove to be the best solution of the problem."

There is one point about which there should be entire agreement, namely, that dairymen all over this Eastern territory can profitably spend some time in getting all available information about pasture improvement. Read every article printed in the farm press, talk with your County Farm Bureau Agent, who is closely in touch with conditions in your locality, and write to the National Fertilizer Association, Investment Building, Washington, D. C., and to your State College, asking them to send you all the information they have on the subject. You will then be able to apply their recommendations to the conditions on your own farm. If you are in a section where most of the land is tillable, you may find the intensive type of fertilization will just meet your needs. On the other hand, if you live in Delaware County or St. Lawrence County where most of the pasture cannot be cultivated, you may find it more profitable to use less fertilizer per acre, but to add it to larger areas.

To Cut Production Costs

The whole aim of pasture improvement, should be to cut down production costs. In fact, by some method this lessening of costs is apparently necessary if dairymen are to make a profit in the next few years. It has always been recognized that pasture grass is the cheapest feed. Better pastures will cheapen production by cutting labor costs and by increasing the number of days' feed which your dairy can get from the pasture every year.

"Better"

is the watchword now

BBETTER profits through better farming—who gets these profits? *The better farmers.*

Why do V-C fertilizers have the call with these men? *Because V-C fertilizers are better fertilizers.* V-C fertilizers can be depended on where nothing must fail. They are the fertilizers *you* should rely on for your own better profits.

**VEGETABLE
GROWER**

Control Weeds Before the Crop Is Planted

WITH potatoes, as with other cultivated crops, it is easier to control weeds before the crop is planted than it is after. This often means that the crop is planted late, but a late crop free from weeds will make a better growth than a crop planted early but which is full of weeds later in the season.

Where land is fall plowed or plowed early in the spring a number of cultivations, preferably a few days after a rain will kill many weeds that have sprouted. After the potatoes are planted many growers go over the ground once or twice before the potatoes come up, either with a planter or a spike tooth harrow. Another harrowing is often given just as the plants come through the ground. After weeds once have a good start in the row the only way to get them out is with a hoe or to pull them by hand.

When growth has gone so far that the vines practically cover the ground more damage than good will be done by cultivating. Weeds will bother little after this and cultivation will kill a lot of fine feeding roots close to the surface. Experiments have shown that the chief reason for cultivating is to kill weeds.

Suckering Sweet Corn

"A recent article advises the removal of suckers from sweet corn. It seems however that we recently read that this is not advisable."

EXPERIMENTS are accepted rather slowly and we frequently read advice which is contrary to the latest findings of experimental nature. Cornell bulletin No. 480 gives the results of some experiments conducted there as well as experiments conducted at other colleges. In general the conclusions are that the removal of suckers is not advisable and in many cases actually reduces the yield of corn.

The removal of suckers late in the season is especially injurious. This can be understood when we remember that the leaves are the parts which manufacture the starch. Moisture and minerals come from the roots but starch is manufactured in the leaves through the action of sunlight and the green coloring matter. The removal of leaves lessens the amount of starch which is produced.

Controlling Radish Maggots

Is there any way of controlling the small maggots that are ruining our radish crop?

THE most effective method of control is to plant the crop early. If radishes are mature about the first of June there is usually not much trouble from maggots. Another method of control is to keep the radish bed screened, which prevents the flies from laying their eggs on the young plants. Where this is not practicable the trouble can be stopped by using a solution of corrosive sublimate, which by the way is a deadly poison, at the rate of 1 ounce to 10 gallons of water. This solution is applied within a week after the plants begin to appear and once or twice later at intervals of about a week. This solution is poured along the radish row. Do not mix this solution in a metal container.

Bordeaux for Celery Blight

Can celery blight be effectively controlled with Bordeaux Mixture?

A THOROUGH spray program will control this trouble fairly well. This will mean either spraying with Bordeaux or perhaps as a substitute, dusting with a copper-lime dust shortly after the plants come up in the seed bed and later at intervals of a week or ten days in the field.

It usually requires from 150 to 200 gallons of spray material per acre.

REDUCE COSTS INCREASE PROFITS

with
RED STEER

Look for this tag

LET'S see how they figure it—these thousands of farmers who hold production costs down to a minimum by using Red Steer.

They know that this year, as every year, their profits will depend largely upon their cost of production per acre.

The first step is to get larger yields per acre, thereby reducing the cost per bushel, or whatever the unit of production.

To do this, you must use good fertilizer. A fertilizer that gives you full dollar for dollar value in *productive* plant food.

Swift's Red Steer is that fertilizer! In addition to

the usual "guaranteed analysis" tag, each bag of Red Steer carries the Certificate of Quality, which gives positive assurance of highest quality—"Best Materials, Double Mixed and Triple Tested."

To cut costs, increase profits, look for the Certificate of Quality when you buy fertilizer.

Ask your Authorized Swift Agent about Red Steer *high analysis*, especially 8-24-8 or 8-16-14. They save you 10% to 15% and even more on the cost of your plant food.

"IT PAYS TO USE THEM"

Ever look into a cow's stomach?

Of course not! But if it were possible you would be amazed at what goes on there!

You'd rush to the nearest feed store for Dried Molasses Beet Pulp—the natural vegetable feed resulting from the extraction of sugar from beets—the feed that keeps the cow's stomach in perfect working order. In addition to being a great feed itself it aids the digestion of the other ingredients in the ration.

Dried Molasses Beet Pulp is **bulky, cooling, laxative, palatable**—just the kind of feed every cow needs in her stomach to keep in perfect health. And your cows must be healthy to be profitable. Fits any ration—replaces corn, barley, oats, silage and other carbohydrate feeds. 6 pounds are equal to 10 pounds of hay. Good for all animals—dairy cows, beef cattle and sheep.

Attractive Prices

Present low prices make it more than ever a profitable buy. See your feed dealer without delay. Shipments made direct from factory closest to buyer.

Suggests Control Measures For Abortion

IN reference to the subject of contagious Bang abortion in the dairy herds of New York State.

Why shouldn't the importation into the state of cattle infected with contagious abortion be forbidden by law; a blood test being required shortly before shipment into the state showing all importations, with the exception of cattle for immediate slaughter, to be negative reactors?

Why wouldn't it be proper to require all sale of cattle except for immediate slaughter within the state be accompanied by a veterinary's certificate showing the reaction of each animal sold to the blood test?

Facts Would Be Known

This would not place any restriction upon the sale of infected cows within the state, but it would place reliable information at the disposal of the purchaser and protect him against the unreliable and uninformed individual.

It, of course, is understood that tolerant reactors are better buys for dairymen with infected herds than are clean cows, so such dairymen should have the opportunity to purchase such tolerant animals by reliable test while at the same time the man with a clean herd would also be able to protect himself and not rely upon the word of an unreliable or uninformed individual.

Such a law would make dairymen more "abortion conscious" and accomplish a great deal toward informing the dairyman and encourage him to raise his heifers as a means of getting a clean herd if he was not able to sell it out.

The losses to dairymen from Bang abortion are tremendous, probably exceeding by far all other cattle diseases, and certainly steps must be taken very soon to control or eradicate this disease. If reactors were slaughtered and indemnity paid to dairymen it would be likely to cripple the industry and place a tremendous financial burden upon the state, while if the method I suggested were used the cost to the state or farmer would be small and the results would be gradual and more effective because of progress from educational methods rather than by arbitrary methods.

From Public Health Standpoint

The probability of the matter being approached from the public health standpoint sometime in the future is practically certain, so such a measure would place the New York dairyman in a position to protect his market still further by being able to meet

such health regulations as may be adopted in regard to milk from reacting cows.

Opposition would no doubt develop but I believe that after a short time under such regulations the resulting benefits would be so clearly demonstrated that the enforcement machinery would find itself out of a job.

The protection it would give the dairyman whether he had a clean herd or an infected one would certainly run into a very large sum annually. Such a saving, I believe, would be welcomed by all forward thinking dairymen.—G. P. H., N. Y.

Protecting Accredited Herds

Has a farmer the right to keep a dairy that has not been tested in a town where other farmers have all tested and are quarantined? If so, why cannot the other farmers buy in some cows that have not been tested and put them with their own herds? Every farmer around him is tested. What could one do about it?—C. M., N. Y.

THERE is nothing in the agricultural law which prohibits the farmer from keeping cows not tested for tuberculosis even though all of his neighbors may have freed their herds from this disease. The New York State Department of Agriculture and Markets can, however, quarantine a man's herd and prevent the sale of products, where 90 per cent of the herds or cattle have been tested in a township or county. If everyone in the town except this man has been tested, we suggest that you give the facts to the State Department of Agriculture and Markets at Albany, New York, asking them to quarantine this man as a protection to your own herds.

Avoiding Udder Troubles

THE number of inquiries from subscribers concerning udder troubles in the dairy have been heavy for the last year or two. In this connection, Professor Connelly of the New Jersey College, gives some worth while suggestions. First, Professor Connelly says that high producing cows are particularly susceptible to udder troubles during the winter and therefore, require special care if they are to be kept in good condition. Causes of the trouble are listed as follows:

First, insufficient stripping; second, lack of bedding which may expose udders to cold, damp concrete floors. Along with this would be undue exposure to severe weather. Three, cramped quarters. Cows that are confined in stanchions during the winter, particularly in narrow stalls, are always in danger of having udders stepped on or being kicked by adjacent cows. Four, stalls that are too short. The cow must be able to lie down without having to lie across the concrete edge of the gutter, resulting in bruises which may cause trouble later.

TB Eradication Progress in Pennsylvania

D. R. C. G. JORDAN, Secretary of the Pennsylvania Department of Agriculture, reports that during the past four years 2,700,000 tests for tuberculosis were made on cattle in Pennsylvania by the Department's Bureau of Animal Husbandry. During this time, the number of counties in the State in the "modified accredited" area has been increased from seven to forty-five. Only twenty-two counties remain to be brought into the "modified accredited" area. This term means that less than one half of one percent of the cattle in such an area are infected. Of all the cattle in the entire State, seventy-eight percent have passed at least one clean test for T. B.

QUICK to the rescue...reaches the inner tissues

THE secret of this great ointment is its effective healing base combined with a remarkable exclusive antiseptic oil. Keep it on hand always for deep penetration and quick healing. Gives amazing results in cases of inflammation, caked bag, bunches and other udder and teat troubles—often heals common hurts between milkings. Equally good for home uses. Big 10-ounce package, 60¢ at feed, drug, hardware and general stores or sent postpaid if dealer is not supplied. Valuable Cow Book free.

Feeding Young Turkeys

"Would you kindly send me a good ration for feeding young turkeys?"—G. W. H., N. Y.

WE began by feeding ours when about 60 to 92 hours old, first some fine gravel. We know when we open a healthy bird's gizzard it is always well filled with gravel. We believe if we have the gizzard prepared to work when the first feed is given that we have done much toward starting that bird on a good digestive system. When you give the gravel, give a drink of clean, fresh water, milk is very good if you have it, but it means a lot of extra work, to care for the dishes it is fed in. We use a steam cooked feed and have for several years. If you don't want to use this I do advise a commercial feed, as it is always mixed the same.

Do not keep changing feed. If you start on one keep it up. If you have trouble, look over every other possible cause before you change the feed. Remember, turkeys should have half and even more of their ration in green feed, so be sure and furnish this all they will clean up in a few minutes several times a day. We use dandelion leaves while tender, then mustard, lettuce and anything of that kind. Above all things, keep everything clean. A good plan is to feed on papers while they are small and use a clean one every time you feed. The mash you can leave before them all the time in hoppers. The weaker ones can always find something to eat after the stronger ones are full. Furnish heat and lots of it.—MRS. C. J. DOXTATER.

Egg Laying Contest Chicks

I am planning to enter several pens of pullets in contests next fall. When should they be hatched for best production?

IN general, the pullets giving the best results start to lay very soon before or very soon after arrival at the contest. The poultrymen wishing to send pullets to the contests starting on October 1, should plan to hatch his chicks, in most cases, in April. Of course, there is a wide difference in the time of maturity in different breeds and in different strains of the same breed, so the actual time of hatching must be determined by the poultryman himself.

To Cure Egg Eating

EGG eating is a vice which seldom develops among birds that are kept occupied and have proper feed and range. Often when the birds are confined owing to bad weather, they may become inactive and the trouble starts. The remedy is to get the birds on range if possible. Supply ample oyster shell and bone, deepen the litter and darken the nests. See that the rations are correct. Gather the eggs frequently for a few days. Some recommend the feeding of milk for a few days. Anything that will get the birds' attention on other matters will help remedy the situation.

Some Feeding Problems

"How much semi-solid buttermilk should laying pullets be fed per 100? How much cod liver oil, mixed in grain ration, should I feed per 100 per day? Give measure in tablespoonfuls please, not weight.

ABOUT two pounds of semi-solid buttermilk per 100 pullets would be the right amount to feed if they are getting a laying ration with meat scrap or some other animal protein in it. It could be increased to three or four pounds without doing any harm if it was necessary, but the common practice among poultrymen is to feed

Reviewing the Markets

Milk Prices

April Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		
2A Fluid Cream	1.66	
2B Cond. Milk		
Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
Hard Cheese	1.50	1.30
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for April 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

March average 13.7c

Butter Closes Firm After Easy Start

CREAMERY SALTED	Mar. 27, 1931	Mar. 20, 1931	Mar. 28, 1930
Higher than extra	29 1/2-30	30 -30 1/2	38 -38 1/2
Extra (92 so.)	28 3/4-29	29 1/2-	37 1/2-
84-91 score	25 1/2-28 1/2	25 1/2-29	31 1/2-37
Lower Grades	24 1/2-25	23 1/2-25	30 -31

The last full week of March was another of variations in the butter market. Trade opened on the 23rd with increasing pressure to sell. Liberal offerings were responsible for the condition and before the morning was over creamery extras had slipped to 29c having opened 1/2c higher. Another factor that affected sentiment considerably was the weakness at Chicago where spot values dropped a full cent.

The situation continued on Tuesday only on a more intense scale. A feeling of weakness in every quarter of the market and a general lack of confidence was much in evidence. As a result creamery extras went down to 28 1/4c. This represented the turning point. On Wednesday the sun came out, more confidence was noticeable and Chicago took a turn for the better. However, the price held at 28 1/4c.

Thursday's market experienced better feeling all around and prices advanced toward the middle of the day to 28 1/2c. Many buyers who had been previously operating very cautiously were buying ahead of their needs. Apparently, they showed wisdom for on Friday creamery extras were back to 29c with the trend upward.

Cheese a Shade Lower

STATE FLATS	Mar. 27, 1931	Mar. 20, 1931	Mar. 28, 1930
Fresh Fancy	15 1/2-16 1/2	16-17	18 1/2-
Fresh Average			
Held Fancy		21-22 1/2	24 -26
Held Average	21 -22 1/2		23 -

Easiness in the cheese market developed to the extent of a loss of one half cent compared with the close of a week ago. The trade has been draggy, little or no activity being reported worthy of note. Fresh cheese has been selling very slowly and on Thursday a few small lots were offered as low as 15 1/2c for fancy and 16 1/2c for selections. There is a fair amount of business in small lots of cured cheese, prices on which are fairly well supported.

Gathered	20-23	21 -23	26 -29 1/2

Receipts of eggs on the New York market staggered the trade early in the week ending March 28. On the 23rd and 24th the posted receipts were so heavy that there was an unmistakable

evidence of nervousness that for a time had the trade worried. The steadiness in the market that prevailed the week previous disappeared and strong selling pressure took its place. The posted receipts early in the week were almost twice as heavy as they were a year ago. As a result of this situation, prices started downward. Wednesday's market checked this movement for there was a growing demand for the Easter trade. This was especially welcome to the nearby trade which had been piling up accumulations in anticipation of the Easter business. On Thursday the market on nearby whites was slightly higher, and in general the trade seemed somewhat improved. Reports of the blizzards from the far West appeared to have a bolstering effect. On Friday nearby whites were moving a little better but they were not clearing entirely.

As the market comes to a close there is much uncertainty as to what is ahead of us next week. The Price Current voices the opinion that the market on mixed eggs (Western goods) is not likely to hold although it says that current prices locally are below a parity with Chicago and central Western costs.

Duck eggs are bringing 53 to 55 cents for Indian Runners. Other nearby are quoted at 48 to 50 cents.

Live Poultry Market Better

	Mar. 27, 1931	Mar. 20, 1931	Mar. 28, 1930

GESE	15-	15-	-18

The live poultry market came back into its own during the week ending March 28, after opening in a rather disappointing manner. Holiday buying started on Friday and practically all lines of poultry are selling at a cent a pound premium. All indications point to continued buying throughout Saturday and Monday when the bulk of the holiday demand will have been satisfied. We expect that premiums will disappear on Tuesday.

Leghorn fowls appear to be enjoying a better demand than colored stock. The broiler market is badly jumbled and it is practically impossible to get any definite line on values. Receipts are quite liberal, most of the receivers being willing to sell their best Rocks at 38c, although some extra fancies were held at 40c and a few scattering sales were reported at that figure.

Meats and Livestock

Cattle—Load good 1179 lbs. Ohio fed steers steady at 8.75. Cows in light supply, steady; few good up to 6.00; common to medium 4.00-5.25; low cutters and cutters 2.00-3.50.

Vealers—Steady, mostly of New York and nearby origin. Good to choice 9.50-12.00; medium 7.00-9.00; cull and common 4.00-6.50.

Hogs—Steady. Good to choice 160-220 lbs. weights 8.25-8.50. Few medium grades down to 7.75.

Lambs—Deck of good to choice 53-55 lbs. Maryland spring Lambs \$12.75. No other sheep or lambs on sale.

Country Dressed Calves—Receipts were liberal to heavy all the week. Fair trading was up to and including Thursday. Friday's receipts were again heavy and buying not so active, and prices were lower all through. Market closed weak and irregular and not cleaning up. Fresh receipts per pound: Choice 12-14c; fair to good 10-12c; small to medium 5-10c.

Hothouse Lambs—Receipts liberal during the week. Demand slow and for fancy only. Undergrades hard sellers some carried over daily. Market closed weak and unchanged from last week. Good to fancy, each, 7.00-9.00, a few higher; fair to good 4.00-7.00; imitations, each 2.00-4.00.

Live Rabbits—Receipts moderate during the week. Demand fair at improved prices. Market closed steady at 17-25c per pound.

THE WORLD'S FIRST REAPER
PUBLIC TEST OF
CYRUS HALL M'CORMICK'S INVENTION
Steele's Tavern, Virginia, 1831 A. D.

INTERNATIONAL HARVESTER

COMES TO THE

Century Milestone

THIS year International Harvester celebrates the McCormick Reaper Centennial, rounding out a century of service to both Agriculture and Industry. This year we retrace the history of a world-wide organization of manufacture, distribution, and service, peering back through generations to the Virginia blacksmith shop where Cyrus Hall McCormick created a machine to reap grain and so released men from bondage to the soil.

One Hundred Years—only a handful of industrial enterprises in the western world can trace a lineage so far! For America is young; she has reared herself magnificently on a foundation that was incredibly primitive in 1831. This forefather of International Harvester concerned himself with the first basic need of human existence, and therein lay his inevitable renown.

Before McCormick, the sons of men toiled with the reaping hook, the scythe, and the cradle, precisely as they had

toiled in the ages before. The need of bread chained all humanity to the land—the vital need of bread held in abeyance the genius of the race. Then came the man of vision with the most fundamental of inventions—McCormick, with his Reaper, a strange device with which one man could do the work of many men in the harvest fields. And with that invention a new magic

began to stir the pulses of the young republic.

The specter of hunger vanished from the land. The frontier of civilization moved boldly westward into the wilderness. Towns grew into cities along the seaboard and new towns bloomed upon the plains, and men and women, inspired by their emancipation, began building the structure of American Industry that has amazed the world.

One Hundred Years! A venerable span in human affairs, but only the threshold to new accomplishments when the torch of achievement is passed from man to man and from generation to generation. The torch kindled by Cyrus Hall McCormick at his forge fire in Virginia is held high today. The old spirit, grounded in traditions of progress and service, is ever renewed. Young blood and new enthusiasms in this International Harvester organization pledge themselves to the service of modern times and to the future.

INTERNATIONAL HARVESTER COMPANY, CHICAGO, U. S. A.

Bodies by Fisher for Oldsmobile have Comfort... Safety... and Value

The stylish Bodies by Fisher for the new Oldsmobile Six provide exceptional strength and durability together with an unusual number of luxury features.

Fisher composite wood-and-steel construction constitutes the strongest type of body ever devised for a motor car. Staunch frames of tough hardwood and strong steel panels—bow-and-slat type roof construction—these assure a body that will retain its fine appearance and give maximum comfort, safety and value throughout a long period of use.

Oldsmobile Bodies by Fisher have comfortable, form-fitting cushions built upon an entirely new type of springs—the Fisher adjustable driver's seat—the Fisher non-glare, vision-ventilating windshield—insulation against noise and weather. Moreover, these new bodies are handsome—roomy—beautifully upholstered in rich, long-wearing fabrics.

You can obtain these Fisher features in Oldsmobile's price field only in the Oldsmobile Six. For Oldsmobile is one of the General Motors cars—the only cars with Body by Fisher.

FISHER BODY CORPORATION • DETROIT, MICHIGAN
Division of General Motors

Real Comfort for Every Driver

The Fisher adjustable driver's seat moves (1) forward and back through a range of three inches to accommodate the individual driver. Easy and convenient adjustment—merely turn the accessible handle (2). Here is an assurance of genuine comfort. Look for it and insist on it in any car you examine.

Front Pillar and Non-Glare VV Windshield

You find (1) a staunch pillar running from sill to roof with one-piece steel pillar cover—no possibility of weakness or leaks. The non-glare windshield (2) makes night driving safer by eliminating dazzling reflections. And (3) complete and instant control of ventilation. Examine these exclusive Fisher features.

Staunch Hardwood Body Frame

Strong, tough hardwoods, reinforced with metal braces, make up the staunch framework of Oldsmobile Bodies by Fisher. This construction explains their great strength, resiliency, durability quiet and easy-riding comfort. Acquaint yourself fully with this construction... insist on getting the value which Fisher bodies assure.

The Chevrolet Coach

For truly economical transportation —the new Chevrolet Six

Now, with the new Chevrolet Six it is possible for everybody to drive a quality car and enjoy the satisfaction of truly economical transportation. The new Chevrolet Six is bigger and better in every way; yet it is one of the lowest priced cars you can buy. Its gasoline and oil economy is unsurpassed, yet it gives you all the smoothness, power and speed of a six-cylinder fifty-horsepower motor. And with a chassis improved and reinforced throughout—

longer, stronger frame; more durable clutch; smoother, longer-lived transmission; sturdier front axle; more rugged cylinder block—the new Chevrolet Six will serve with a minimum of upkeep expense. *Truly economical transportation—and with it the comfort, convenience and beauty of roomier, sturdier Fisher Bodies.* This is what Chevrolet is offering in a quality car priced well within the reach of every buyer—a remarkable new value that no careful purchaser can afford to disregard.

NEW CHEVROLET SIX

Four days' desserts from *one* mixing job!

That's what Calumet's Double-Action can do for you

Bake this one **MONDAY**

Apricot Upside Down Cake

$\frac{1}{4}$ recipe Miracle Cake
(See basic recipe below)
 $\frac{3}{4}$ tablespoon butter

$\frac{3}{4}$ cup sugar
18 apricot halves,
canned or fresh

Melt butter in loaf pan (9 x 5 inches) or in an 8-inch iron skillet. Add sugar. Stir until melted. On this arrange apricot halves. Pour cake batter over contents of pan. Bake in moderate oven (325° F.) then increase heat slightly (375° F.) and bake 25 minutes longer. Cool 5 minutes; then loosen cake from sides of pan. Turn upside down on dish with apricots on top. Add whipped cream, if desired, and serve at once.

Bake this one **TUESDAY**

Pineapple Torte

$\frac{1}{4}$ recipe Miracle Cake
(See basic recipe below)
 $\frac{1}{2}$ cup sugar

2 egg whites, stiffly beaten
4 slices pineapple, diced,
or $1\frac{1}{2}$ cups grated

Turn batter at once into greased 9-inch layer pan. Store in refrigerator, keeping pan closely covered with damp cloth and waxed paper. When cake is to be baked, beat sugar thoroughly into egg whites, pile lightly on cake batter, and bake in moderate oven (325° F.) 45 minutes. Just before serving, cover with diced or grated pineapple, and with whipped cream, if desired.

Bake this one **WEDNESDAY**

Hot Spiced Cottage Pudding

$\frac{1}{4}$ recipe Miracle Cake
(See basic recipe below)
 $2\frac{1}{2}$ tablespoons molasses

$\frac{1}{2}$ teaspoon cloves
 $\frac{1}{2}$ teaspoon nutmeg
1 teaspoon cinnamon

Add molasses and spices to cake batter and beat well. Turn at once into greased loaf pan (9 x 5 inches) and store in refrigerator, keeping pan closely covered with damp cloth and waxed paper until pudding is to be baked. Bake in moderate oven (350° F.) 45 minutes. Serve at once with raisin sauce.

Bake this one **THURSDAY**

Mocha Cake

$\frac{1}{4}$ recipe Miracle Cake
(See basic recipe below)
Mocha frosting

Turn batter at once into greased 9-inch layer pan. Store in refrigerator, keeping pan closely covered with damp cloth and waxed paper until cake is to be baked. Bake in moderate oven (375° F.) for 20 minutes, or until done. When cold, cut cake into halves and put together with Mocha frosting.

HERE'S THE BASIC RECIPE!

Miracle Cake

$4\frac{1}{2}$ cups sifted Swans Down Cake Flour
 $4\frac{1}{2}$ teaspoons Calumet Baking Powder
 $\frac{1}{2}$ teaspoon salt

1 cup butter or other shortening
2 cups sugar
4 eggs, well beaten

$1\frac{1}{2}$ cups milk
2 teaspoons vanilla
(All measurements are level)

Sift flour once, measure, add baking powder and salt, and sift together three times. Cream butter thoroughly, add sugar gradually, and cream together until light and fluffy. Add eggs and mix well. Add flour, alternately with milk, a small amount at a time. Beat after each addition until smooth. Add vanilla. The batter is now ready to divide into four equal parts. With one fourth, make the Apricot Upside Down Cake to be served that day. Then turn the remaining batter into three pans as directed in each of the above recipes. Cover each pan closely with a damp cloth and waxed paper and store in refrigerator until ready to bake.

IMAGINE the convenience! The time-saving! In one mixing job, you can prepare batter for as much as four days' baking. Each day you bake a different dessert and *know* that last or first—every one will be a masterpiece!

Why can you do this with Calumet Baking Powder and get such unfailing perfection? Such delicious, unusually fine results—even after batter has stood four days?

Sure success! Here's why!

Because Calumet acts *twice*. It acts first in the mixing bowl. But the second action waits—it stays in reserve until you put the batter into the oven. Then the second action begins and continues the leavening. Up! . . . up! . . . it keeps raising the batter and holds it high and light. Your cake bakes beautifully—*perfectly*—even though you may not be able to regulate your oven temperature with utmost accuracy.

At the left are four fascinating desserts that use this new baking idea. Mix the basic recipe—Miracle Cake. Then follow the easy directions. Divide the batter equally into four pans—bake the first at once—cover each of the other three with damp cloths and waxed paper—store in the refrigerator—bake them as described—one triumph a day!

Pure! Economical!

All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action nor in the amount that should be used. And not all will give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action!

To-day, get Calumet. Try it. See for yourself why Calumet is the largest-selling baking powder in the world. Remember, use no more than *one* level teaspoon of Calumet to each cup of sifted flour. This is the usual Calumet proportion and should be followed for best results—a splendid economy which the perfect efficiency of Calumet's leavening action makes possible! . . . Mail coupon for the new Calumet Baking Book—full of delightful easy recipes. Calumet is a product of General Foods Corporation.

LOOK! LOOK!

SEE CALUMET'S DOUBLE-ACTION

Make this test—See for yourself how Calumet Baking Powder acts *twice* to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's *first* action—the action that Calumet specially provides to take place in the mixing bowl.

After the mixture has entirely stopped rising, stand the glass in a pan of *hot* water on the stove. In a moment, a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's *second* action—the action that Calumet holds in reserve to take place in the heat of your oven. Make this test to-day. See Calumet's *Double-Action* which protects your baking from failure.

Farm News from New York

Governor Roosevelt's Agricultural Commission Passes on Farm Bills

A MEETING of Governor Roosevelt's Agricultural Advisory Commission was held in Albany on Thursday, March 26th, to consider matters before the Legislature of importance to New York State farmers.

After Henry Morgenthau, Jr. called the meeting to order, Commissioner Parran of the New York State Health Department appeared before the Commission and explained the Wood-Hutchison Bill now before the Legislature, which would set up county boards of health in the place of the present system. Dr. Parran said that under this proposed Bill, it would be possible to bring greatly increased health and medical facilities to rural communities without increasing local costs to taxation. The Commission spent considerable time discussing the entire rural health problem but made

no specific recommendations at this time.

money is not enough to make is easy or practical for local Granges to put out worthwhile exhibits at the State Fair.

3. For completion of the Animal Husbandry program of the New York State College of Agriculture...\$24,000. The State Government has been liberal on this project during the past two years but has started some work in the Animal Husbandry Department that is not possible to finish without some additional help.

4. Extension and research work in rural electrification...\$20,000.

Electricity is making rapid progress on farms, but from the farmers' standpoint, we still do not know much about it or how to use it to best advantage.

5. Equipment for the new Horticultural Building at Geneva...\$65,000. This item explains itself.

6. Appropriation for a horticultural building at the New York State Fair \$350,000.

Fruit growers of the State have planned, worked, and hoped for this building for many years.

7. For a new building at the Delhi State School of Agriculture...\$75,000.

8. Appropriation for a building at the Farmingdale School of Agriculture and for other enterprises at Farmingdale...\$205,000.

To Speed Up TB Eradication

As stated above, we are unable to say at this time how many of the above bills will pass, but the first ones are considered more important by the Commission.

Considerable time was spent by the Commission in the afternoon discussing the need of a program for speeding up intensive tuberculin testing in New

York State so that all of the cattle in the State will be tested by January 1st, 1935. It was brought out that New York now has one-third of all of the untested cattle in America, that long before 1935 all the other states surrounding us will have their cattle tested, and that there is also grave danger that before that time New York City will pass an ordinance requiring milk only from tuberculin-tested cows. It is soon going to be possible, it was stated at the Commission meeting, for New York to get milk from cows free from tuberculosis from other states without taking it from New York counties and dairies that have not been tested. A committee was appointed to study the situation and, if it deemed it advisable, to formulate a plan for speeding up the testing campaign. This committee will report at another meeting of the Commission.

An important motion was carried by the Commission approving of the Kirkland-Smith resolution in the Legislature providing for a legislative committee to study regional markets and marketing. The Commission also approved another Kirkland-Smith bill against imitation butter.

Federal Loan Associations Meet At Syracuse

THE Federal Farm Loan Associations of New York State held their annual meeting at Syracuse, Tuesday and Wednesday, March 24th and 25th. These Loan Associations, you understand, are farmers' cooperative organizations associated with the Federal Land Bank of Springfield and indirectly with the whole Federal Farm Loan system. Nearly all of New York State's Associations were represented at Syra-

cuse with a large gathering of presidents and secretaries.

During the afternoon session the Secretary of the Springfield Bank, H. P. Perkins, presided, introducing first the President, Edward H. Thomson. Mr. Thomson, with a series of charts, showed the delegates the condition of the Federal Land Bank of this district at the present time and took some time to outline some facts regarding the present farm situation. He made it clear that there is an unfortunate increase in the number of farms on which the Federal Land Bank has been obliged to foreclose because the owners were unable to meet payments on their mortgages. Mr. Thomson showed that this was due to a considerable extent to the depressed condition of agriculture.

It was brought out, however, during the meeting that the Federal Land Bank of Springfield is in excellent condition, generally speaking, and that the farmers of the first district, comprising New York, New Jersey, and New England, are on the whole much better off than they are in almost any other farm section in America.

The Secretary of the Federal Land Bank of Wichita, Kansas, was introduced, and gave a most illuminating and helpful talk about gas and oil leases. Much territory of the Kansas Bank is, in the gas and oil country, so the speaker was well able to discuss from experience this kind of leases of farm property. His theme was that most of the gas and oil leases offered by oil companies were unfair to the farmers and that the farmers should be very careful before signing these unfair leases.

E. R. Eastman, Editor of American Agriculturist and a Director of the Springfield Bank stated that he had made a survey of gas and oil leases in New York and that the majority of them were unfair from the farmers' standpoint. Mr. Eastman said that the only right kind of a lease would give the farmers the same royalty on any gas discovered as is offered for oil. Most of the companies offer a one-eighth oil royalty to farmers but offer a small rental per gas well instead of a royalty. Such rentals are unfair.

Investigate Before You Sign

The point was made time and again that no farmer should sign one of these leases without consulting the Federal Land Bank or a reliable lawyer.

Incidentally, the gas and oil lease becomes a lien or incumbrance upon property, making it difficult to sell property.

At the evening banquet, Mr. Wilfred W. Porter, Director of the Springfield Bank from Syracuse, New York, acted as toastmaster. He introduced the Reverend Bernard Clausen, who gave the delegates and their wives, who were present, a most inspiring address. E. R. Eastman talked briefly about the kind of farmer who is entitled to credit and who will make the best of it, and the program was closed by a most instructive address by M. C. Burritt, Member of the Public Service Commission. Mr. Burritt told his audience that farmers have a right to use the Public Service Commission more than they do in order to safeguard their rights on any problems that come under the Commission's jurisdiction.

Conservation Week

THE week beginning April 1 has been set aside by Governor Roosevelt as Conservation Week, to be devoted to the consideration of questions relating to a better understanding of the State's natural resources.

It may be interesting to know in connection with Conservation Week that at the present time, the State Department has received orders aggregating better than 14 million trees for planting this year. This is an increase over last year of approximately a million. Orders have come from nearly every county in the State with 4-H members taking a substantial proportion of those orders. The planting of trees is not only a

(Continued on Page 25)

Master Farmers Visit Schenectady and Albany

THE party given the Master Farmers at WGY Wednesday, March 25, was well attended. About thirty Master Farmers and their wives were present, and all reported a very enjoyable time. A full account of the day will be given in next week's issue. Watch for it.

no specific recommendations at this time.

There are a large number of bills now being considered by the Legislature calling for appropriations for various kinds of agricultural work and institutions. These bills were all brought before the Commission and explained in some detail by Commissioner Berne A. Pyrke of the State Department of Agriculture and Markets. A committee was then appointed to arrange the bills in the order of their importance, placing the ones first which the Commission thought should have first consideration by the Legislature and by the Governor. Owing to a shortage of State funds, it probably will not be possible for all of these bills to become laws.

Approve Bill on TB

During the afternoon session the committee recommended first that the bill providing for one million dollars more appropriation for tuberculin testing should be approved. This bill is in addition to the regular appropriation put in the budget for two and one-half million dollars to pay indemnities. The additional one million dollars has already passed the Legislature. Five hundred thousand dollars of this is to be used to pay indemnities on last year's claims, and the other five hundred thousand is to be used with the two and one-half million, making a total of three million dollars to pay indemnities for 1931.

Appropriation Bills in Order of Importance

We give below the committee's recommendations in their order with brief explanations of the bills. The Agricultural Advisory Commission accepted the report of its committee and recommended to the Governor and the Legislature that the financial bills be considered in the following order:

1. To celebrate the New York State Agricultural Society's one hundredth anniversary...\$5,000.

This Society, the oldest going farm organization in America, founded in 1832, will be one hundred years old next year. It is planned to have a real historical celebration emphasizing the customs and implements of by-gone times.

2. To increase the money available to put on Grange exhibits at the New York State Fair...\$5,000.

It was brought out that the present

CATTARAUGUS COUNTY—The March session of the county Dairymen's League Association was held Saturday, in Dayton. Miss Vera McCrea, Home Department speaker of New York City was in attendance. The annual conference of Grange Masters, lecturers and secretaries will be held in Randolph on April 14. Miss Elizabeth L. Arthur, lecturer of the New York State Grange will be in charge. The ladies of Randolph will serve dinner at noon. Two Cattaraugus County girls have won honors in their college work. Miss Katherine Pingrey of Delevan has received the coveted Phi Beta Kappa key at Syracuse University where she is a student. Also, Miss Hazel Trass of Salamanca has just been awarded a scholarship which will entitle her to a year's study in France. It was received through the Franco-American Student Exchange of the Institute of International Education. She is, also, a student at Syracuse University.

Fine Spring weather after a very mild winter, with sugar making in full swing. Milk and eggs, the principal products offered for sale in county, are low but every farmer has a job, something to be thankful for.—M.M.S.

CHAUTAUQUA COUNTY—The 21st of March finds the fields still covered with a heavy blanket of snow. The snow is so deep in the woods that very few have started tapping their sugar bushes. It has been a very unusual winter, sleighing on the unplowed roads continuously since the 28th of November and yet no extreme cold weather or blistering storms like we usually get in Chautauqua County. Everybody will say it has been a good winter. The fields have been well protected, and went into the winter without being frozen, and with the snow protecting them through most of the trying month of March, the chance for a good hay crop this year should be favorable. —A. J. N.

MONROE COUNTY—We have had grand weather with a recent heavy fall of snow going off gradually and without any damage. Many are pruning apple trees. Not many auctions; the few that are conducted are on a cash basis. Imple-

ments are the only things selling cheap. Even at that some seem to have money left.

Good cows cost from \$90 to \$125 and \$150, just ordinary ones \$65 to \$85. Most of the last mentioned you have to board for their company.

Farmers are very much interested in good seed which is a cheerful outlook during the depression. Good seed is always cheap in my estimation and one of the smallest items in the cultivation of a crop.—T. D. S.

In the Hudson Valley

SARATOGA COUNTY—Roads are in very good condition for this season; snow is melting rapidly. No rain for a long time and cisterns, wells and so forth are dry in many places.

Not many auctions around here and not much moving. Farmers are cutting wood and fence posts and getting ready for Spring's work.

Butter and eggs very cheap; not as many chickens being hatched as usual. —Mrs. L. W. P.

COLUMBIA COUNTY—Spring arrived with birds, butterflies, bees, wasps, flies, caterpillars, etc. Snow banks are still seen in northern exposures and on north barn buildings and in the woods. Thirty-six names are to be on the New Lebanon War Memorials placed in the Cemetery of Evergreens under auspices of No. 23 Girl Scout Troop; to be dedicated May 30. A 4-H Club of Girls reorganized in Elizaville. There are 24 home-making clubs now in the county, with 266 enrollment. An orthopedic clinic was recently held in Hudson. The examining physician was Walter E. Craig, M.D.

Debris along Hudson's South Bay Road is to be removed with the aid of a "bulldozer." A County Calf Club of 4-H Club Boys has been organized. James Keeler, of Craigside Farm, Hudson, was elected President. He was a champion 4-H dairyman last year. The Assistant Farm Bureau Manager talked to the boys about dairy work and showed them how to test soil samples for acidity.

County potatoes \$1.00 bushel; eggs 25c a dozen; hay baled, \$15.00 and \$22.00 at farm are one farmer's prices.—Mrs. C. V.

Heavy Work this month

Watch your tractor's lubrication!

Your tractor needs especially good care during this month of heavy work. Did you start the season off by doing a good job of flushing and cleaning the crankcase and transmission? If not you should stop and do so immediately. It will mean much to the life and efficiency of your tractor.

Check the oil filter again to make sure it is functioning properly. Get out the manufacturer's instruction

book again. There you will find all kinds of precautions that should be taken at the beginning of the season.

For lubrication, consult your manufacturer's instruction book for proper draining periods and greasing directions. See the complete Mobiloil Chart at your dealer's for the correct grade of Mobiloil for crankcase and transmission.

Mobiloil has proved its amazing ability to stand up hour after hour. However tough the plowing, however great the drag of disking, Mobiloil stands up.

Lubricating suggestions for April work

(Left) **PLOWING:** To prevent power losses, the main essential with a disk plow is to keep the disks sharp and clean. Use Mobilgrease on the bearings if equipped with pressure fittings. Use Voco Wheel-bearing Grease in grease cups. These greases last longer and withstand the heavy pressures. Use Mobiloil "CW" freely from hand oil can on the lifting mechanism.

(Right) **SEEDING CORN:** Here, the greatest wear is on chains and open gears, caused by dust and dirt. Clean these parts every few days with kerosene and a stiff brush. Then brush on Mobilgrease lightly. If driving gears are contained in oil-tight housing, keep filled with Mobilgrease. Use Mobiloil "CW" in all oil holes.

(Left) **DRILLING:** Open gears on drills should get the same careful cleaning and lubricating attention as with corn planters. All parts carrying pressure fittings should get daily applications of Mobilgrease. Use Mobiloil "CW" in all ordinary oil holes.

(Right) **DISKING:** On disks the bearings usually carry heavy loads and work under dusty conditions. Here, as with disk plows, be sure to keep the disks sharp and clean. If the bearings are equipped with grease cups use Voco Wheel-bearing Grease. Apply Mobilgrease to pressure fittings. Mobilgrease sticks. If the implement stands in the rain, Mobilgrease will not wash off.

Little Danger of Overcharging Car Battery

IT is not advisable to turn the car's headlights on in the daytime.

In the early days batteries and generators were not in their present state of high development. Batteries were undersized and would charge fully with a few hours driving. In order to avoid injuring batteries it was often suggested to turn the lights on, on long drives in summer as a means to reduce the charging rate.

Today this practice is not needed. If a motorist is in the habit of taking unusually long and steady trips he can have the generator charging rate reduced which automatically takes care of the situation.

There is only one way that a driver can tell if the battery is being overcharged and that is if it needs to be refilled with water more than once a week.

Another good bit of information for motorists to know about concerns spark plug gaps. If the car at any time operates with a jerky or uneven motion, have the spark plug gaps examined as the electrodes probably are worn too far apart.

Care of Septic Tanks

WHERE the septic tank is of the proper construction and is carefully operated, it often runs for many years with no attention whatever.

In old tanks, it sometimes becomes necessary to remove the sludge out of the bottom if it gets closer than 18 inches to the water level in the tank. If the scum gets six or eight inches thick it is often advisable to remove part of it, but an inch or so of scum is desirable. If the sludge is deep and there is no scum, it may be that you are using too much strong lye and disinfectants and that these have killed off the bacteria which normally work in the tank. If the tank seems to have a tendency to fill up and run

over it is likely that the dry well or tile field into which the tank discharges has clogged up. In case of persistent trouble, it is best to get some experienced man to look it over and find out just what is the cause of the trouble and how it can be remedied.—I. W. Dickerson.

Lightning Losses Small on Rodded Buildings

IT is reported from Cornell University that during the past fifteen years the loss from lightning on properly rodded buildings in New York State was \$7,500, while on unrodded buildings it was nearly \$750,000 or just about 100 times as great. This is despite the fact that the great majority of the better farm buildings are rodded; and if the hazard was about equal, the loss on rodded buildings would be much greater than on the fewer and poorer unrodded ones. And yet you still hear people who claim that lightning rods are a fad and do not offer any real protection! Write to the Department of Agriculture, Washington, D. C., for a free copy of Farmers Bulletin No. 1512—"Protection of Buildings and Farm Property from Lightning". This covers the subject very thoroughly.—I. W. Dickerson.

When the Power Goes Off

"What happens when the power goes off—will the motor start up again when it comes back on?"

THAT depends upon what kind of a controller is used with the motor. For all general purposes, the controller should be such that the return of power will not retard the motor. This is simply a question of safety, for a person might find the machine stopped and, while working on it, he might be injured if it suddenly started up with return of power. Under modern conditions power is very seldom off and, considering a possible

(Continued on Opposite Page)

Three Horse Wagon Eveners

WE have many requests for pole or tongue eveners for use on wagons, manure spreaders, and so on, which for satisfactory results should meet these requirements:

1. Should equalize the draft among the three horses, so that each pulls the same.
2. Should not crowd any horse and should allow each horse to pull straight ahead.
3. Should not throw undue tongue weight on either horse's neck.
4. Should produce the minimum amount of side draft or tendency for the wagon or other implement to run sideways.

If the proper lengths of evener arms are used, there is usually no trouble about proper equalization of pull, and

the main thing to be watched out for is to avoid undue side draft. With a wagon there is no way of entirely overcoming this tendency for the wagon to run sidewise except to put the middle horse between shafts so he can walk directly in front of the center of draft of the implement, or else to set the tongue far enough over one way or the other so the middle horse can still be in front of the center of the implement. In the following diagram (D-696) of three-horse tongue eveners designed to work on wagons or other implements without changing the tongue, the side-draft is not enough to interfere with satisfactory operation. The dimensions shown will give reasonably good equalization and freedom from side draft.

(Continued from Opposite Page)

choke-up with automatic feed and general safety, it is best to insist on a controller that has undervoltage protection as it is called. A common exception to this rule, however, is found in the pump motor that is operated by a float switch or pressure switch. In this case, the float or pressure gauge automatically turns the power off and on and if the motor stops from low or no voltage it will restart without attention upon the return of power. Such a unit is always starting up unexpectedly and the caretaker must school himself to open the line switch even when the pump is stopped before doing any work around the set.

Motors Need Little Attention

"Can an electric motor safely be left to operate by itself or will it speed up?"

MOTORS such as are used on farm power lines do not speed up more than a slight amount when the load is suddenly taken off, as when a belt breaks. In fact, there are thousands of such motors running in industrial plants that are never seen oftener than once a month, when they are oiled, and we know of one case where a motor was completely overlooked for over a year, and it was operating faithfully the whole time. With oil in the bearings, there is no reason for anyone standing by while a motor is operating, in fact, much time can be saved by rigging up home-made devices so that the driven unit will be self-feeding.

Costs More to Plow With Three Horses

ALTHOUGH a three-horse team can plow more in a day than a two-horse team, the cost of plowing each acre is higher with three horses. The cost of the use of the third horse is more than the saving in cost of man labor. However, if the third horse would be idle it is good practice to use it, and, too, by using three horses enough time may be saved to plant a crop earlier or to plant more acres and thus increase the possibilities of greater income.

The size of the field, the number of horses or the kind and size of tractor used, and whether the land is sod or stubble determine the time required to plow an acre of land.

In plowing small fields, considerable time is lost in making the turns. If fields are both small and irregular, more time is lost. Large rectangular fields take least time for each acre, for less time is lost in turning and in plowing the headlands.

Two-horse teams walk more slowly and stop oftener than three-horse teams. Most tractors pulling two plows travel faster than horses. Further, no time is required for resting when a tractor is used. To plow one acre of sod with a two-horse team takes from 5½ to 7½ hours. With a three-horse team drawing a single plow, it takes from 5 to 6 hours; with a tractor and a two-bottom plow, it takes from 2 to 3½ hours.

Running Water for Fire Protection

ALTHOUGH farm water systems are not generally given credit in insurance ratings, the U. S. Department of Agriculture states that they may be of great value if a fire be discovered in its incipient stage. It is suggested that when a pressure system is installed, a few well-placed hose connections should be provided. Water is probably the best means of extinguishing fires caused by matches and smoking; by overheated stoves, furnaces and their pipes; hot ashes and coals; bonfires or burning rubbish. Invariably it is the best method for putting out a blaze caused by spontaneous ignition. Altogether for more than 40 per cent of all farm fires, water is the most effective means of protection.

YOU'RE FIRED, MR. WATER-THIN! GET OFF THIS FARM!

WHEN YOU fire Mr. Water-thin you save money. For that fellow never does anything but waste hard-earned cash.

Who is this Mr. Water-thin? He's the quart or more of thin, non-lubricating, fast-vaporizing oil that or-

inary refining leaves in every gallon of motor oil. It is so light-bodied, so useless in tractor, truck or passenger car that Quaker State engineers have nick-named it "water-thin." And they throw it out!

You find this stuff in every gallon of ordinary motor oil because ordinary refining can't remove it. But

Quaker State gets it out with a special process which has been developed by Quaker State engineers—and installed in every one of Quaker State's refineries, *the most modern in the industry.*

And because "water-thin" goes

out, Quaker State's famous extra quart goes in! For Quaker State replaces "water-thin" with rich, full-bodied lubricant. Quaker State gives you four full quarts of lubricant to the gallon—instead of three quarts and one of waste. So you really get an extra quart of lubrication. *You get an oil so good it has become the world's largest selling Pennsylvania Oil.*

Quaker State is made entirely from 100% pure Pennsylvania Grade Crude Oil. Quaker State is so

free from impurities that it doesn't require acid treatment in refining. That's mighty important to you! For acids tend to destroy some of an oil's oiliness.

You'll get satisfaction and you'll save money if you standardize on Quaker State. For that extra quart of lubrication in every gallon of Quaker State means sweeter, smoother performance—and more service, better service, from tractor, truck and passenger car!

THERE'S AN EXTRA QUART OF LUBRICATION IN EVERY GALLON

BABY CHICKS

Sieb's OVERSIZE Chicks

BIG DISCOUNT

5¢

We want to do our share in helping the farmer and poultry raiser by giving them the greatest bargain we have ever offered. These chicks are all Sieb's very finest pure-bred OVERSIZE chicks. No second or third grade, but the kind we have bred and cultured for many years to grow larger, mature quicker and produce 200 eggs or more per hen. If there ever was a time when the poultry raiser needs more eggs and more pounds of meat per bird, it's now, and Sieb's OVERSIZE chicks should meet this emergency. Make every dollar count by raising Sieb's OVERSIZE chicks. They pay. We can ship you 100 or 10,000 of these fine chicks the day you want them. Send for catalog or order from this ad. 100% live prepaid delivery guaranteed.

about two pounds per 100 birds per day.

If you mix 3 tablespoonfuls of cod liver oil into the daily grain ration for 100 hens you will furnish enough to take care of their requirements for vitamin D.—F. E. Andrews.

A Cannibalism Cure

FEATHER picking and cannibalism have been bothersome in many New York state flocks. Painting the picked birds and about on-third of all the flock with a prepared chick pick, roofing cement, or pine tar will be helpful.

A satisfactory home-made chick pick, is made by mixing one-half ounce of quinine sulphate with one-half pint of blood red common paint. Such a mixture should be applied freely to the feathers on the back, near the tail, and below the vent. The chickens are attracted by the red paint because it resembles blood but are repelled by the extreme bitterness of the quinine sulphate. It may be necessary to repeat the treatment after a few weeks. The feeding of whole cabbage or beets helps to keep the birds active and tends to reduce picking. There are also several excellent commercial mixtures on the market.

Coccidiosis Again

"Would you please inform me what is the matter with my chicks? We are losing a chick now and then. Their crops seem to be full and they dump around and die. Their heads turn purple before they die."—C. W. P., N. Y.

WOULD say that the symptoms indicate that they may have coccidiosis. This is a disease that affects young chickens when they are from two to ten weeks of age. It may also occur in a chronic form when the young stock is nearly mature or even in old hens. Medicine does not seem to be of much value in case of this disease. Remove all chickens from the flock that appear droopy just as soon as you notice them. Keep the poultry house clean and disinfect it frequently. If you can give the chickens plenty of milk to drink it will help.

Next year raise your chicks on ground where there have been no chickens for two or three years if it is possible to do so.—F. E. Andrews.

Some Old and Faithful Horses

(Continued from Page 5)

young folks of these days certainly miss something their fathers and mothers enjoyed. With a good steady horse all that was necessary was to wrap the lines around the whip and he would always find his way home. Ruth Ballinger of Marlton, New Jersey, sent us a picture of Gamwood who has the record of two minutes and thirteen seconds for the mile. "About twenty years ago," says Miss Ballinger, "he was my father's 'sparking' horse. He is still as sound as a rock and hasn't a blemish."

It is unusual to have a team working together much after they are thirty years old. Mr. Eugene Barnes of Deposit, N. Y. sends us a picture of such a team. The one on the left was thirty-eight years old when she died and the one at the right is still living at the ripe age of thirty-seven years. Mr. Barnes is standing at the head of the horse. The horses were raised by his father who gave them to Mr. Barnes. Mr. Barnes writes: "I would like to have the picture returned." Practically everyone who sent us pictures made the same request—another evidence of the affection between man and horse. Such a vast number were received that

PULASKI, N. Y.

it will take a little time for us to do so, but you may rest assured that within a short time all pictures sent us will be returned.

Mrs. William Hamilton of Ludlowville, N. Y. sends us Prince's picture and wrote as follows:

"I am sending you a snapshot of Prince and his master. He was thirty-eight years old and always owned by the same person. In horse days when corn was planted to the fence, he would proudly cultivate when it was in tassel without eating any or breaking it down at the ends. A team of five year olds like him would not be traded for a tractor."

* * *

A few letters where pictures were unprintable were so interesting that we cannot omit them. A very interesting letter comes from Mrs. Wilhelmina Budd of Poughkeepsie, New York. Mrs. Budd sends us the first page of the January 13, 1918, Poughkeepsie Sunday Courier, containing a story of Nellie, the last of the old car horses in Poughkeepsie. Nellie died January 15, 1919 at the age of thirty-four years. Mrs. Budd, in writing us about the horse says: "Dad always said when anyone came to see her that he did not want to sell her as she had earned her rest. When she died Dad's heart was very heavy and if he was living today he would be very pleased to know of your interest in this horse. Mother is still healthy and was eighty-one years old February 22."

* * *

Another interesting letter comes from William L. McCullough of New-ark Valley.

"I notice you wanted the picture and history of good old horses. I have not got exactly that but I have in mind a history of a horse and her descendants that might be interesting. The horse or her descendants have been in the family continually nearly sixty years. My father said this horse was a three year old and he broke her in the spring and I remember that I was past 24 when we had a neighbor mercifully put her out of the way. So I practically grew up with her and her colts. She raised 12 good colts and we have always kept some of her descendants in the family and today I have some of the fourth and fifth generations.

At one time we had this old mare, as we called her, and seven of her colts, and the experiences that I and my brother, who is now passed on, had in handling and driving these colts might fill quite a book—some wild horseback rides, some upsets and runaways, but nothing serious. I remember one being sold to a family in the village and one winter, when the man was away from home I took care of this horse and did other chores for my board and attended high school and through that I got into learning a business I followed for a time. The experiences and acquaintances I had sometimes make me think that they would not have happened if it had not been for this horse.

Then another night when driving this horse I made the acquaintance of a young lady I had met once before. Well, the result was she has been my partner in the ups and downs of life for more than thirty years. We have a fine robe that was made from the hide of one horse and when we use it we often think of many incidents that happened when we were driving this horse and mate.

I might tell quite a good deal more about this horse but no doubt this is enough."

Few contests have given the editors more enjoyment than this one has. Because of the requirement of a picture, we did not anticipate such a large number of entries. The many who responded prove again that the horse still has an important place on thousands of eastern farms.

KERR'S NEW LOW PRICES

PLACE your order now for Kerr's Lively Chicks. These prices are attractive for chicks that have a rich laying inheritance from birds that have made big records in leading egg-laying contests.

The MAYTAG Roller Water Remover

WITH **DIVIDED** ROLLS
AN OUTSTANDING FEATURE

NOTICE HOW IT
SWINGS OPEN

Available
with electric
motor for
homes with
electricity.

CHURN AND MEAT GRINDER
Attachments may be had for the Model
B washer at reasonable extra cost.

EXCLUSIVELY Maytag—the roller water remover is superior to all other methods of wringing or water removal. It is specially appreciated on big farm washings.

Lift the tension release and the rolls may be instantly spread five and a half inches between centers—obvious safety and convenience. The top roll is *flexible*, the lower one *firm*—both oversize. Garments are wrung evenly dry and every last particle of dirt or soap flushed out. Buttons pass through safely. The drain is enclosed and reverses automatically. The rolls cannot revolve unless the roller water remover is locked in one of its *seven different positions*.

PHONE or WRITE the nearest Maytag dealer. Ask about the Maytag free home trial and easy divided payment plan. If the Maytag doesn't sell itself, don't keep it.

Tested Butter Recipes

Butter Frostings

Take two cups of powdered sugar, butter the size of a large egg, and three tablespoons of milk. Melt the butter by pouring boiling water into the bowl in which you mix the frosting and then putting the butter in the hot bowl. Mix to a creamy consistency and flavor. Spread on top and sides of cake. Can be colored, or made with cocoa, or melted chocolate or varied in many ways. This is a good frosting if you think your cake is likely to dry soon, as the butter in the frosting keeps both cake and frosting soft. If the cake is to be served warm it is easy to mix freshly mashed strawberries or raspberries in the part that is placed between the layers, keeping the top plain. Of course, in case you use juicy fruit the milk must be lessened.

Butter Sauce

Nothing is better for various puddings than butter sauce, which is the old time hard sauce of our grandmothers' day. Rub together smoothly two cups of powdered sugar and enough soft fresh butter to make it

SWEETHEART PILLOWS, NOS. C-1091 AND C-1092 make a very *lightsome, attractive touch* for a bedroom. Both numbers are of fine, crisp organdy, No. C-1091 being light green, and C-1092 a pretty pink with blue tinting for collar and hat. Both measure 16 x 16 inches when finished. Lace may be used for finishing edges. Price, including top, back and floss for embroidery, is 50c. Without floss, price is 35c for each pillow. Order from Embroidery Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

like creamy candy. Put a teaspoon of the sauce on each helping of the hot pudding and serve at once.

Buttered Vegetables

Instead of having cream sauce always try serving new potatoes, boiled onions, beans, carrots, cabbage and other vegetables in butter sauce. Boil till tender, drain and shake over the fire with plenty of melted butter to glaze the vegetables. For potatoes put a very little chopped parsley or celery leaves in with the butter. This makes a pretty company dish. Do not cook or wilt the fresh leaves but mix till all are flecked with them. The old fashioned garden chives chopped fine, and even tender onions cut in fine pieces make a good flavoring for buttered dishes. Buttered peas mixed with tender young carrots shining with the sauce are delicious.

Old Fashioned Butter Dressing

Cook noodles or macaroni in enough water to keep from scorching. Season highly and just before serving cover the dish in which the noodles are served with a dressing made of two cups of bread crumbs lightly fried in three tablespoons of fresh butter. The crumbs should be a light brown and crisp. In serving place some of the dressing with each helping of noodles.

Butter Taffy

Take one cup each of brown sugar, white sugar and corn sirup and boil until it cracks when tested in cold water. Have ready a bowl with three tablespoons of cream and a lump of butter as big as a large egg on which pour slowly the hot sirup beating rapidly. Beat until it is thick and then pour in a buttered tin or plate. Properly made this taffy never gets hard. It is delicious and wholesome for children and the butter is not boiled. Flavor with any desired flavoring.

Time Well Spent—

Time taken to read the advertisements in **AMERICAN AGRICULTURIST** is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad," be sure to mention the name of

Lack of Repose Makes Problems Seem Harder

WE hear so much talk about the period of depression through which we are passing, that the following excerpt from an article in a recent Federal Council Bulletin, by the English woman minister, A. Maude Royden, comes as a real ray of light in a darkened world:

"The longer I live and the busier I get the more I realize that if you allow your *spirit* to be busy, if you allow yourself to feel that you have no peace in your life and no calm and no time to think, you will do all your work as a person might in a delirium; that the reason why our public life is so disordered and our private life so hampered by anxiety is because we will not be still and know God. When a person gets nervous he cannot do his best. All the world is nervous today. Our problems are not insoluble; it is we that stupefy ourselves by our nervousness and terror.

If even a few of us could so order our lives that there was in them the serenity that makes for wisdom, I think that even the stupidest of us would be much wiser than at present we think possible. We put ourselves down as unable to help, unable to do anything to solve even the problems of our own lives and homes. There is a

Youthful Chic

DRESS PATTERN NO. 3032 *was* youthful chic for all day occasions in its printed crepe silk freshness. The cowl drape and flounce trimmed sleeves lend a softened touch to the bodice. The clever shaping of the skirt at the hip line and its easy fullness at the bottom mark it for a favorite. Plain crepe silk with a touch of white in embroidered organdy at the neck or lace on the flounce sleeve frills would be very smart indeed. The pattern cuts in sizes 16, 18, years and 36, 38, 40 and 42 inches bust. The medium size requires 3½ yards of 39-inch material. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. Add 12c for one of the spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

way, but while we are blind with anxiety we cannot see it.

How is it possible to escape that anxiety? "Be still, and know that I am God." He speaks to us, if we would only listen, in beauty, in music, in nature, in the voices of the past, in our own consciousness; in a thousand ways, would we but listen. Though we may not call it God or know that it is God, though we may deplore our inability to see God or hear Him, yet there is in our hearts the unconscious knowledge that where there is beauty

The Favored Jacket Suit

PATTERN NO. 3025 is right up to the minute in favor, as every smart dress of the semi-sports character has its own little jacket, usually in contrasting color. It is just as practical as it is smart. The bodice of the dress has a slight cowl drape in front while the skirt has its plaits arranged to form a box-plait effect. The dress in plaided blue crepe silk, with plain blue wool crepe jacket, would be stunning. However, plain wool jersey with tweed jersey or crepe silk in two contrasting shades are smart combinations for this pattern which may be obtained in sizes 14, 16, 18, 20 years, and 36 and 38-inches bust. Size 16 requires 3½ yards of 39-inch material for dress with 1½ yards of 39-inch material for coat. Price, 15c.

or inspiration God is speaking, and there at last we can be silent and listen to the divine voice.

I am sure there is much of that seeking for God in the desire of people for what is beautiful in sight and sound; but you can find it also in the silence of your own hearts, and there will come to you that serenity which will enable you to solve your anxieties, which will find for you a way when there seems no way, which will give you strength, though you seem to have sought it many times in vain."

Replacing of broken tufting twines is important in mattress care.

Old Faithful Geyser

Take a Holiday With Us

THE American Agriculturist is going to Magic Yellowstone Park next August. Come along, Readers—the vacation is for you too!

Together, we'll see Old Faithful, the Grand Canyon, the Montana Rockies, the Northwest's vast irrigation and livestock enterprises, the scenic Mississippi, the Dakota Bad Lands, Minnesota's lakes and woods.

Cities, Cowboys, Ranches, Indians and Rangers will entertain us. We'll travel in the height of style, we'll feast on the meals for which Northern Pacific and Burlington Railroads are famous.

The Cost? Surprisingly low—and it includes all expenses, even personal tips. Ask for the fare from your home town:

AMERICAN AGRICULTURIST

Just David--By Eleanor Porter

"Come in, David," said Simeon Holly quietly. "My son wants to hear you play. I don't think he has heard you." And again there flashed from Simeon Holly's eyes a something very much like humor.

With obvious hesitation John Holly relinquished the violin. From the expression on his face it was plain to be seen the sort of torture he deemed was before him. But, as if constrained to ask the question, he did say:—

"Where did you get this violin, boy?"

"I don't know. We've always had it, ever since I could remember—this and the other one."

"The other one!"

"Father's."

"Oh!" He hesitated; then, a little severely, he observed: "This is a fine in-

but I'd defy Sherlock Holmes himself to make head or tail of the sort of lingo he talks, about mountain homes and the Orchestra of Life! Father, what does it mean?"

Obediently Simeon Holly told the story then, more fully than he had told it before. He brought forward the letter, too, with its mysterious signature.

"Perhaps you can make it out, son," he laughed. "None of the rest of us can, though I haven't shown it to anybody now for a long time. I got discouraged long ago of anybody's ever making it out."

"Make it out—make it out!" cried John Holly excitedly; "I should say I could! It's a name known the world over. It's the name of one of the greatest violinists that ever lived."

"But how—what—how came he in

names mean little to me. But doubtless somebody would have known. However, that is all past and gone now."

"Oh, yes, and no harm done. He fell into good hands, luckily. You'll soon see the last of him now, of course."

"Last of him? Oh, no, I shall keep David," said Simeon Holly, with decision.

"Keep him! Why, father, you forget who he is! There are friends, relatives, an adoring public, and a mint of money awaiting that boy. You can't keep him. You could never have kept him this long if this little town of yours hadn't been buried in this forgotten valley up among these hills. You'll have the whole world at your doors the minute they find out he is here—hills or no hills! Besides, there are his people; they have some claim."

There was no answer. With a suddenly old, drawn look on his face, the elder man had turned away.

Half an hour later Simeon Holly climbed the stairs to David's room, and as gently and plainly as he could told the boy of this great, good thing that had come to him.

David was amazed, but overjoyed. That he was found to be the son of a famous man affected him not at all, only as far as it seemed to set his father right in other eyes—in David's own, the man had always been supreme. But the going away—the marvelous going away—filled him with excited wonder.

"You mean, I shall go away and study—practice—learn more of my violin?"

"Yes, David."

"And here beautiful music like the organ in church, only more—bigger—better?"

"I suppose so."

"And know people—dear people—who will understand what I say when I play?"

Simeon Holly's face paled a little; still, he knew David had not meant to make it so hard.

"Yes."

"Why, it's my 'start'—just what I was going to have with the gold-pieces," cried David joyously. Then, uttering a sharp cry of consternation, he clapped his fingers to his lips.

"Your—what?" asked the man.

"N—nothing, really, Mr. Holly,—Uncle Simeon,—n—nothing."

Something, either the boy's agitation, or the luckless mention of the gold-pieces sent a sudden dismayed suspicion into Simeon Holly's eyes.

"Your 'start'?—the 'gold-pieces'? David, what do you mean?"

David shook his head. He did not intend to tell. But gently, persistently, Simeon Holly questioned until the whole piteous little tale lay bare before him: the hopes, the house of dreams, the sacrifice.

David saw then what it means when a strong man is shaken by an emotion that has mastered him; and the sight awed and frightened the boy.

"Mr. Holly, is it because I'm—going—that you care—so much? I never thought—or supposed—you'd—care," he faltered.

There was no answer. Simeon Holly's eyes were turned quite away.

"Uncle Simeon—please! I—I think I don't want to go, anyway. I—I'm sure I don't want to go—and leave you!"

Simeon Holly turned then, and spoke.

"Go? Of course you'll go, David. Do you think I'd tie you here to me—now?" he choked. "What don't I owe to you—home, son, happiness! Go?—of course you'll go. I wonder if you really think I'd let you stay! Come, we'll go down to mother and tell her. I suspect

(Continued on Page 26)

"Under Frozen Stars" Begins Next Week

IN our next issue you will find the first installment of our new serial, "Under Frozen Stars" by George Marsh. The hero of the story is in charge of a Canadian fur trading post but finds most of the business going to a rival firm. He is given a year to make good and with two faithful followers he heads into the wilderness to find what is wrong. He locates the trouble and finds plenty of adventure.

Of course, there is a heroine in the story and the fact that she is the daughter of our hero's business rival, naturally adds to the complications.

To those who read "The Valley of Voices" when it appeared as a serial, we only need to add that "Under Frozen Stars" is written by George Marsh, the author of "The Valley of Voices." Do not miss the first installment next week.

strument, boy,—a very fine instrument."

"Yes," nodded David, with a cheerful smile. "Father said it was. I like it, too. This is an Amati, but the other is a Stradivarius. I don't know which I do like best, sometimes, only *this* is mine."

With a half-smothered ejaculation John Holly fell back limply.

"Then you—do—know?" he challenged.

"Know—what?"

"The value of that violin in your hands."

There was no answer. The boy's eyes were questioning.

"The worth, I mean,—what it's worth."

"Why, no—yes—that is, it's worth everything—to me," answered David, in a puzzled voice.

With an impatient gesture John Holly brushed this aside.

"But the other one—where is that?"

"At Joe Glaspell's. I gave it to him to play on, because he hadn't any, and he liked to play so well."

"You gave it to him—a Stradivarius!"

"I loaned it to him," corrected David, in a troubled voice. "Being father's, I couldn't bear to give it away. But Joe—Joe had to have something to play on."

"Something to play on! Father, he doesn't mean the River Street Glaspells?" cried John Holly.

"I think he does. Joe is old Peleg Glaspell's grandson."

John Holly threw up both his hands.

"A Stradivarius—to old Peleg's grandson! Oh, ye gods!" he muttered. "Well, I'll be—" He did not finish his sentence. At another word from Simeon Holly, David had begun to play.

From his seat by the stove Simeon Holly watched his son's face—and smiled. He saw amazement, unbelief, and delight struggle for the mastery; but before the playing had ceased, he was summoned by Perry Larson to the kitchen on a matter of business. So it was into the kitchen that John Holly burst a little later, eyes and cheek aflame.

"Father, where in Heaven's name did you get that boy?" he demanded "Who taught him to play like that? I've been trying to find out from him,

my barn?" demanded Simeon Holly.

"Easily guessed, from the letter, and from what the world knows," returned John, his voice still shaking with excitement. "He was always a queer chap, they say, and full of his notions. Six or eight years ago his wife died. They say he worshiped her, and for weeks refused even to touch his violin. Then, very suddenly, he, with his four-year-old son, disappeared—dropped quite out of sight. Some people guessed the reason. I knew a man who was well acquainted with him, and at the time of the disappearance he told me quite a lot about him. He said he wasn't a bit surprised at what had happened. That already half a dozen relatives were interfering with the way he wanted to bring the boy up, and that David was in a fair way to be spoiled, even then, with so much attention and flattery. The father had determined to make a wonderful artist of his son, and he was known to have said that he believed—as do so many others—that the first dozen years of a child's life are the making of the man, and that if he could have the boy to himself that long he would risk the rest. So it seems he carried out his notion until he was taken sick, and had to quit—poor chap!"

"But why didn't he tell us plainly in that note who he was, then?" fumed Simeon Holly, in manifest irritation.

"He did, he thought," laughed the other. "He signed his name, and he supposed that was so well known that just to mention it would be enough. That's why he kept it so secret while he was living on the mountain, you see, and that's why even David himself didn't know it. Of course, if anybody found out who he was, that ended his scheme, and he knew it. So he supposed all he had to do at the last was to sign his name to that note, and everybody would know who he was, and David would at once be sent to his own people. (There's an aunt and some cousins, I believe.) You see he didn't reckon on nobody's being able to read his name! Besides, being so ill, he probably wasn't quite sane, anyway."

"I see, I see," nodded Simeon Holly, frowning a little. "And of course if we had made it out, some of us here would have known it, probably. Now that you call it to mind I think I have heard it myself in days gone by—though such

State but a private duty and we should be more than glad to cooperate with the State in the conserving of our forests.

PLANS are under way to enlarge the fish hatcheries of the State and to plant several hundred more fish fry this year than have been put out in preceding years. According to State Conservation Commissioner Henry Morgenthau, Jr., one reason for the increase is the increased economies in the purchase of fish food which through a policy of open bidding will result in a saving of 20 per cent. New extensions and improvements authorized by the Commissioner include the enlargement of the St. Lawrence Hatchery at Ogdensburg, the Caledonia and Bath hatcheries in western New York and the Randolph rearing station also in western New York. Plans to rehabilitate the Linethigo hatchery in Livingston County are also under consideration.

The enlargement of the State hatcheries will enable the planting of thousands of more fish in our game streams than has been possible in the past.

Holstein Friesian Association Meeting

THE Holstein Friesian Association of America will hold their annual convention at Syracuse, N. Y. on June 3. This is the first time in ten years that the meeting has been held in Syracuse, which was the scene of many of the first meetings of the Association. The ninety nominations for delegates to attend the nomination for New York State have just been announced. From these ninety candidates, twenty-eight delegates will be selected by a vote of the members.

Planting Potatoes on Long Island

TWO reports as to conditions in New York State have just come to our notice. Cortland County reports snow everywhere while, on Long Island, farmers are commencing to plant potatoes. Around Riverhead and Mattituck, planting operations are going forward rapidly and it is expected that all

will be in the ground within a short time. It will be nearly two months before some of our up-state growers can think of planting potatoes.

Farm Board Announces "Hands Off" Policy

THE chief topic of general as well as of local interest is an announcement by the Federal Farm Board of the discontinuance of stabilization operations. The announcement was made last week Monday by members of the Board that in the future the Government would not make purchases for the 1931 wheat crop.

The immediate effect of the announcement was a sharp break in the wheat market at Chicago, especially on July futures. Other grains fell in sympathy with wheat and the entire grain market showed a weakened condition. The break was partly counter-

Prize Winner

GLENN BOWERS of Waterville High School is the winner of the first prize of \$3.00 for the month of March. This prize was offered several months ago to students in high school vocational agriculture and is still open to those who wish to send in contributions. Our offer was to pay \$3.00 as first prize, and space rates to any other items published.

balanced by a feeling of optimism later in the week and more speculative trading is being done by private interests.

Various solutions for the problem of the western wheat farmer have been suggested but none of them seem to have offered the needed relief. The wheat grower is evidently hard hit. The next question is: "What are we going to do about it?" The backing the Farm Board has given the United States wheat market for a considerable portion of the past year has held the price well above that of the world. It is reported that this has not proven an

entire success but what the situation will be when the support is withdrawn from next year's crop is a question.

The farmer of New York State is more or less interested in the outcome of the present situation although he probably will not be seriously affected by the movement. The market for soft wheat is more or less local and probably will not be affected to any great extent by the movement of the Board. Since more grain is consumed in the New York milk shed than is produced, the immediate effect will be lowering of the price of retail grain which should be encouraging to the majority of dairymen in the State. Private interests who have attacked the policy of the Farm Board ever since it was organized, are rejoicing at what they call the failure of the plan. Strong co-operatives, on the other hand, who have been supported by the Farm Board, claim that the Board has not failed but has put the responsibility where it belongs, that is on the farmer and his increase or decrease of acreage for the coming season. Whoever is right we will watch with interest the developments that are due to come both politically and economically this summer.

Western New York News

MORE than 80 Grangers from Western New York recently clubbed together and made a two-day excursion trip to Washington. While in the capital, they were welcomed at the White House by Mr. Hoover who later posed for a picture with the group on the lawn.

Erie County Deputy, W. A. Clark of Eden, with Mrs. Clark, were among those who went. The trip proved so enjoyable that it may be made an annual affair.

With a full day of celebration, the new Niagara Frontier Food Terminal and Niagara Frontier Growers' Cooperative Market, Inc. was formally opened on Monday, March 16.

In his address, Charles E. Denney, President of the Erie Railroad, declared the new terminal was designed with full regard for requirements of the future and that its completion was not to be regarded as the finish of the enterprise, it being only the nucleus of a huge food distributing center of the future.

John J. Herman, Treasurer of the new terminal, traced the history of the old Elk Street Market from its founding, 80 years ago, and Mayor Roesch said the new terminal was placing Buffalo in its rightful place as the second largest food distributing center of New York State.

Keys to the new market were given formally to Mr. Denney by John W. Cowper, general contractor of the market. Mr. Denney presented the keys to Francis D. Wood, president of the market corporation, and Henry G. Marquart, President of the Farmers' organization, affiliated with the project.

It was estimated that 50,000 persons visited the new market building during Monday. A buffet luncheon was served all day.

Last week's notes reported it doubtful whether Erie County could completely fill the third of the three cars being loaded with food produce for the drought sufferers, but there proved to be enough to fill it to overflowing.

One girl and thirteen boys have joined the 1931 Erie County Baby Beef Club and the steer calves were distributed to the young feeders March 17. All the animals are Aberdeen-Angus, from six to eight months in age, and average 528 lbs.

Sugaring has begun but is not yet a rushing business at this date, March 23.

The old folks say that Spring really begins when the sun crosses the equator and that the direction of the wind at that time influences the weather for the following six months. On that day it blew from the southeast.

Better Lawns for Small Towns

(Continued from Page 3)

was held in his neighborhood. This one-year garden won first prize, although it was pitted against gardens four or five years in the making upon which long hours of back-breaking labor had been expended. Everything was growing luxuriantly—except the rose bed. That was a sorry sight. The reason was that Dr. and Mrs. Turrentine had been especially anxious to obtain beautiful roses and had been afraid to test out the new fertilizers on their bushes. Instead they followed the customary procedure of their neighbors, with lamentable results.

Easily Applied All at Once

Dr. Turrentine made use of five chemical compounds, generally for sale by commercial dealers. These were potassium ammonium sulphate, potassium ammonium phosphate, ammonium phosphate, urea phosphate and potassium nitrate.

These are all applied at the same time. They should be mixed thoroughly in equal parts in the powdered form. Then a handful of the mixture should be dissolved in a gallon of water. This should be sprinkled over the soil about the roots of the plants very lightly. Too much will be fatal. The mixture is extremely powerful.

Three types of fertilizer ordinarily are sold to home gardeners in a city—sheep manure, bone meal and cottonseed meal. The first and last contain all three necessary elements. The second has only phosphorus and nitrogen. But all these are of comparatively low grade. Considerable quantities would be required to provide as much plant food as a few drops of Dr. Turrentine's mixture.

The cost of fertilizing a good sized backyard in this way is very small. Ten pounds of each of the formulae should be enough to carry the home owner through the Summer. They should cost him altogether, at retail prices, \$3.00 or \$4.00.

Dr. Turrentine made one discovery by accident, but he doesn't advise any-

body to repeat his experiment until they have obtained some experience in handling the powerful mixture. He spread it, in powdered form, very lightly over his lawn on a hot evening intending to turn the hose on the next morning, so that it would soak into the soil. There was a heavy dew that night and when the sun came up the powder dried all over the yard. He found, curiously, that all the weeds in his lawn died, while the grass was unhurt. Afterward it grew luxuriantly. But he had happened to hit on just the right amount. If he had used a trifle too much the grass also would have been killed.

After applying the mixture to a flower bed, Mr. Turrentine emphasizes, it is necessary to turn on the hose and wash off any that has fallen on the foliage and stalks. Otherwise it will kill them.

Clay Soil Really a Good Soil

The hard red clay soil which is so prevalent in many parts of the country, and which bakes under a hot sun until it can hardly be broken with a sledge hammer, need not discourage anybody, Dr. Turrentine believes. It is, in fact, one of the very best soils possible when it is properly fertilized, and the trouble is that so much of it is removed in building operations. It can be loosened somewhat with plentiful mixture of organic matter, but this is not necessary.

Just David

(Continued from Page 24)

she'll want to start in to-night to get your socks all mended up!" And with hear erect and a determined step, Simeon Holly faced the mighty sacrifice in his turn, and led the way downstairs.

* * * * *

The friends, the relatives, the adoring public, the mint of money—they are all David's now. But once each year, man grown though he is, he picks up his violin and journeys to a little village far up among the hills. There in a quiet kitchen he plays to an old man and an old woman; and always to himself he says that he is practicing against the time when, his violin at his chin and the bow drawn across the strings, he shall go to meet his father in the far-away land, and tell him of the beautiful world he has left.

THE END.

HANDY ANDY Says "Here's How"

To Preserve Wood Floor in a Poultry House

By Ray Inman

Any preservative treatment should be applied to flooring before it has been laid.

When joists and boards have been cut to shape give them 2 or 3 heavy coats of hot creosote

If floor is already laid several heavy coats of hot creosote will help, but not entirely preserve it.

—I.W.D.

Law on Setting Traps

I am a subscriber of the American Agriculturist and wish for some information about game laws. Has a farmer a right to set traps under his own buildings for weasels or in his own saw dust pile under his tumbled-down mill without tags of owner? Is it breaking the law to set a trap under one's own building with small teeth on one jaw? Moreover, would such a trial come under the jurisdiction of the Justice of the Peace? If not before a justice, what Court would decide it. If this is a crime what is the maximum penalty for trapping without tags and using traps with teeth on the jaws? Has a Game Warden a right to trespass on private property looking for evidence? Will you please answer this at once. Does the law require that a minor have his name on his traps?

WE forwarded this inquiry to the State Conservation Department at Albany who reply as follows:

"We wish to advise you in reply that Section 207, Sub. 1 of the Conservation Law reads as follows: 'All traps set or used for the purpose of taking any wild animal shall be stamped with the name of the owner in such manner that the same shall be legible at all times.' There is no exception made in reference to this subdivision. We therefore hold that the name of the owner must be stamped on all traps set for the purpose of taking wild animals regardless of where they may be set. Sub. 3 of this section reads as follows: 'No trap of the leg-gripping type shall be used for taking wild animals that has teeth in the jaws or has a greater spread of jaws than six inches. No trap shall be set in such a manner that an animal when caught shall be suspended alive.'

A violation of either of the above mentioned subdivisions of Section 203 of the Conservation Law is a misdemeanor. Therefore, a person violating either of these subdivisions may be prosecuted in a criminal action before a Justice of the Peace having jurisdiction and if found guilty, he may be fined from ten to one hundred dollars for the first offense. He is also liable to a penalty to be recovered in a civil action of sixty dollars for a violation of either of these subdivisions and an additional penalty of twenty-five dollars for each quadruped taken.

We would also advise you that the subdivisions mentioned above are applicable to minors under the age of sixteen years who may set traps.

Game Protectors have a right to trespass on private property for the purpose of investigating violations of the Conservation Laws. They also have a right to search any building other than a private dwelling where they have reasons to believe that the Conservation Laws in relation to fish and game are being violated without a search warrant."

No Answer

NEARLY a year ago we received a letter from a subscriber saying that he had sent a check for \$29.75 to the

Lincoln Way Manufacturing Company of Petersburg, Illinois, for a tray cleaner for incubator trays. Our subscriber wrote about this and received no reply. Later he did receive a letter saying that the matter would receive attention but still did not receive the order which he asked for. Our subscriber appealed to us and we wrote two letters to the Lincoln Way Manufacturing Company but did not receive the courtesy of a reply from them.

Later we appealed to another Standard Farm Paper in Illinois who also wrote them several letters without results. We then appealed to the Post Office Department who replied that they did not feel justified in taking action because of the fact that this was the only complaint that had been turned over to them. We secured a report on the owner of the Lincoln Way Manufacturing Company saying that he was financially responsible although he does not seem to take care of some of his customers.

In fact we went after this complaint in practically every avenue through which we usually handle such complaints, without results. Our subscriber has received nothing for his money.

Collecting Damages for Dogs

The other day a car hit our dog and killed it. We put in a claim with the insurance company but cannot seem to get a settlement for it. Are we entitled to damages in a case like this?

IT is our understanding that while an insurance company might be legally liable for the death of a dog that it is a little bit difficult under usual circumstances to get any indemnity. In order to prove that you are entitled to damages you have to show that the dog is legally licensed, that he was not a trespasser on the highway, and that the injury or death of the dog was the result solely of the carelessness of the driver. This, of course, would be somewhat difficult to do.

On the other hand, if your dog was trespassing on the highway and as a result of it an owner of a car tried to avoid hitting him and ran into a ditch and injured his car, he might have a legal case against you for collecting damages which his car suffered due to the trespassing of your dog on the highway.

Size of "No Trespass" Signs Changed

A law just passed by the New York State Legislature reduces the minimum size of no trespassing signs for hunting and fishing from the former size of twelve inches square, to a minimum of eleven by eleven inches.

Tioga County Farmer Killed By Train

NO PROTEST This draft will not be honored unless Policy No. 7247937 issued by the North American Accident Insurance Company is attached.	Claim No. <u>R-54498</u>	New York	Check No. _____

One Thousand and No/100 - - - - - Dollars			
PAYABLE THROUGH THE NORTHERN TRUST CO. CHICAGO, ILL. 2-15			
			<i>M. K. Gordon</i> Claim Examiner.

THE many friends of Fred H. Roper, a prominent and successful farmer in Tioga County, New York, and president of the County Agricultural Society, were shocked to hear of his sudden death.

Mr. Roper was on his way to the Frank B. Tracy farm to get some wheat when his car was struck on the Wicks Crossing of the Lackawanna Railroad. There were no eye witnesses to the accident, but apparently Mr. Roper was killed instantly.

Mr. Roper held a North American accident insurance policy which he purchased from an A. A. subscription salesman and his estate promptly received a check for \$1,000 from the Insurance Company.

Participating Policies On Automobile Insurance Are Popular With New York State Farmers

OUR net premiums last year increased 33½% over 1929. Farmers appreciate their opportunity to buy *Automobile Insurance on a profit-sharing basis*. This participating plan appeals to them strongly, probably because so many are members of cooperative organizations.

We allow 10% off "conference manual" rates as outright deduction when premium is paid. This is \$3.00 to \$10.00, depending on make and size of car or truck.

Also 10% additional deduction where policyholder has had no automobile accident during past 24 months.

This is a New York State Company, with Home Office in Buffalo, with Claims Service Branches throughout state, and claims representatives from coast to coast.

Owen B. Augspurger, President.

HOME OFFICE: BUFFALO, N. Y.

Write for rates and exact savings on your car and truck. Ask for Agency Proposition, if you think you would like to represent the "GUARDIAN." You may be in a good territory which is still open.

WHO VOUCHES FOR IT?

MOST every one has heard from sales people of something "just as good" as the article he has called for by name and wishes to buy.

It may or may not be "just as good." How are you to be assured? Who vouches for it? How are you to be recompensed if the voucher fails? Does it pay to take chances?

When you see an article widely and continuously advertised, and know that people continue to demand it, you have the highest possible assurance of its worth.

The advertising columns of your home publications are a tolerably safe guide. They tell of what is standard—what things meet with public approval. It cannot be doubted that in general you will be safe in buying such articles, rather than substitutes urged upon you for reasons not always in your interest.

The intelligent, successful buyer first familiarizes himself with standard or reputable goods by reading the advertisements—and then insists upon his preferences.

The reading of advertisements in your publications should be a habit, a persistent habit. Read for the news they contain, news of things that touch your living every day. Read and note. The impressions will not be effaced. They may lie dormant in your mind for a time, but they will come forth to serve you when the need arises.

As your habit grows, you will find the advertisements as fascinating as any other part of your reading.

FORGATE FARM
Jamesburg, New Jersey
March 25, 1931

Have 7000 chicks from 1 to 6 weeks of age on G. L. F. Starting and Growing Mash. Size and feathers.

March 19, 1931

G. L. F. Exchange, Inc., Ithaca, N. Y.

Gentlemen:

I am glad to report the success we are having with G. L. F. Starting and Growing Mash in the growing of our early chicks. Just now we are feeding 2500 chicks on this feed and are well pleased with the results. Our pullets, which were hatched February 12th, averaged 10.86 ounces each and the cockerels 12.55 ounces at five weeks of age. The feathering is good and they are a fine, healthy lot.

Last year we used G. L. F. feed exclusively in raising approximately 8000 chicks and liked the feed very much.

Very truly yours,
Wallace H. Rich

GOLDEN GUERNSEY MILK CERTIFIED

YARBELL FARM
404 E. Tenth St., New York City
March 19, 1931

We have been using G. L. F. Starting and Growing Mash and G. L. F. Super Laying Mash with Alfalfa Meal for the past four years with very satisfactory results. In 1930 we raised about 2000 pullets, and they were a very fine lot. We sold 600 of them and the 1400 which we kept were placed in our laying house during the months of August and September, and from that time up to February let they averaged about 45 per cent production. They are still laying remarkably well, over 50 per cent at the present time. We are very well pleased with their condition.

March 9, 1931

G. L. F. Exchange, Inc., Ithaca, N. Y.

Gentlemen:

Last season I had 220 birds in my R. O. P. pen under the supervision of the N. Y. State Official Poultry Breeders Association. 112 of these birds laid over 200 eggs each, or an average of 240.98 eggs per bird (1 bird 300 eggs, 1 bird 250 and 10 birds over 275). These birds were reared on G. L. F. Starting and Growing Mash and then placed on G. L. F. Laying Mash over 275). They were fed no green feed about the addition of any extra greens or minerals, except ter shell.

Jameson, N. Y. R. D. #6,
March 19, 1931

Good: G. L. F. Exchange, Ithaca, N. Y.

Dear Sirs:

My experience with G. L. F. feeds has been very satisfactory. I started 2400 Rock Beggars on

March 21, 1931

Dear Sirs:

Referring to your letter of the 17th, I have not hatched any chicks yet this season. Will have a hatch off the 23rd and I assure you that the chicks will get G. L. F. Starting and Growing Mash, as I already have it in my bins. I intend to rear my usual amount of 900 to 1000 chicks and fully expect to raise 90 per

Ask Your Neighbor—

In your community there are poultrymen who have used G. L. F. Starting and Growing Mash and are using it again this year. Ask these men about this feed. They are using it because of the results secured.

This open formula mash has been proved on millions of chicks and while the feed is mixed for results first of all—the cost is surprisingly low.

On present markets G. L. F. Starting and Growing Mash is being delivered to Agent-Buyers in the Syracuse freight zone at approximately \$46.00 per ton. To this price must be added the Agent-Buyers' handling charges.

HICKORY RIDGE FARM
EDWARD L. PLASS, OWNER
HOLMSTOWN, N. Y.
March 21, 1931

G. L. F. Exchange, Inc., Ithaca, N. Y.

Dear Sirs:

In answer to your inquiry of March 17, 1931, I expect to rear about 6000 chicks on G. L. F. Starting and Growing Mash this season. 700 of these chicks are in an electrically heated battery the latter of February and at 2 1/2 weeks of age they averaged 10.86 ounces each.

The results we obtained last year in rearing on G. L. F. Starting and Growing Mash caused me to use it again this year.

Very truly yours,
Edward L. Plass

Milanville, Pa., March 20, 1931

Dear Sirs:

Your letter of March 17th received. We are feeding G. L. F. Starting and Growing Mash again this year. The following are the number of chicks put in the brooder, date of hatch and mortality:

Feb. 24 - 620	Mortality - 4
Mar. 4 - 3200	" - 7
" 12 - 900	" - 2
" 18 - 550	" - 72

Last year we brooded 9200 chicks with a mortality of only 5.8%.

We think the G. L. F. feed is better this year than ever.

Very truly yours,
G. Henry Hoker

Gentlemen:

In 1930 we sold 600 broilers on G. L. F. Starting and Growing Mash and Chick Scratch.

March 18, 1931 we started 1000 chicks on the G. L. F. Starting and Growing Mash. They are doing well.

Yours truly,
Joseph Waugh

Seeing Is Sometimes Hard Believing

Master Farmers Visit "the House of Magic" and State Departments

"VENI, vidi, vici"—(I came, I saw I conquered). If I am not mistaken, it was that old braggart of a Caesar who boasted of his triumphs in the foregoing words. Speaking of their trip to Albany and to Schenectady the other day, the Master Farmers of New York and their wives might well have changed Caesar's boast to "We came, we saw, we had a whale of a good time!"

There are forty-five Master Farmers of New York State in the classes of 1928, '29, and '30, and the majority of these, many accompanied by their wives, came, under the auspices of AMERICAN AGRICULTURIST, from their homes in all parts of New York State to visit the General Electric Works at Schenectady and the Legislature and Governor Roosevelt in Albany, on March 25th.

A good example of the true Master Farmer spirit was furnished by Mr. and Mrs. James O. Fyffe, of Walton, Delaware County, whose automobile slipped and turned over on the way to Schenectady.

By E. R. EASTMAN

Nothing daunted, they righted their car, climbed into it, and drove it on its own power on to Schenectady.

The weather, too, was nothing to brag about. It snowed and rained all day, but in spite of the age of some of the Master Farmers who are old in years but not in spirit, the weather made no difference with the plans or fun of the party.

Master Farmer John Fallon, of Constable, New York, was on time. You know, John sometimes has a little habit of being late. He is a member of Governor Roosevelt's Agricultural Advisory Commission, which has done so much for agriculture during the last two years, and last winter John came into one of the sessions of this Commission about three hours after it had started. He took a seat by my side, looking kind of sheepish, and leaned over to explain why he was late. It seems he had to take a sleeper from Constable to Albany, but when it arrived in Albany in the morning,

instead of getting up, John turned over for another snooze and when he woke up again he was way down the Hudson River somewhere below Poughkeepsie. So he had to travel mostly all morning the hundred miles or so back to Albany to attend this meeting. I hope some of John's friends in the North Country will remind him of this little incident.

The Mystery of Radio

The Master Farmer party gathered promptly at Station WGY of the General Electric Works at nine o'clock and visited the WGY broadcasting studios. I will bet that everyone of you have pictured in your mind what the place looks like from which all of these splendid radio programs come. All of the party saw these studios at first hand and learned a little something about the mysteries of broadcasting. I say that they learned a little, for radio is a great science in itself and even those who have studied its mysteries for years admit that

★A "Special Brand" Tire is made by a manufacturer for distributors such as mail order houses, oil companies and others under a name that does not identify the tire manufacturer to the public, usually because he builds his "first line" tires under his own name. Firestone puts his name on every tire he makes.

Double Guarantee—Every tire manufactured by Firestone bears the name "FIRESTONE" and carries Firestone's unlimited guarantee and that of our 25,000 Service Dealers and Service Stores. You are doubly protected.

What Will the Cows Eat Next Winter?

How to Grow an Emergency Hay Crop for the Dairy

WHAT am I going to do for hay this year?" is a question many of our best dairymen in the New York milk shed are asking. The hard winter of 1929-1930, coupled with the drought last summer, seriously injured thousands of acres of new seeding and many dairymen are now running short of hay. At the same time, the prospects for next year are far from bright, and in such a situation, the need of some kind of an emergency hay crop becomes imperative.

There are several plants, both legumes and non-legumes, that the New York farmer can grow, the particular crop varying with the land available, the time the crop can be planted and climatic and soil conditions. In some cases, it is best to grow the various crops alone, in other cases, a combination of one or more may be practicable because of the increase in quality and quantity of the hay produced.

"That all sounds very nice but what good does it do me?" is the question a dairyman up in Chenango County asked me the other day.

"Well", I answered, "perhaps we can go over your particular situation so that we can really supplement your supply of hay for the coming season. For example, did you ever try growing oats and peas?"

"I planned to put in 18 or 20 acres of oats this Spring. I suppose some of it could be used for oats and peas," said Mr. Jeffrey.

"Then, personally," I said, "I think your best bet is to grow oats and peas this year on some

By **WALTER HOOSE**,
Assistant Editor, American Agriculturist

of the ground that you had planned to grow oats alone. Mix your oats and peas, about equal parts by volume, before sowing, then plant about three bushel to the acre of the mixture. You can seed satisfactorily with this mixture and a quality hay can be made by using your ordinary variety of oats, such as Cornellian or Swedish Select with an early variety of peas such as Golden

into prominence as an emergency hay crop in New York State and since these plants are legumes that are high in protein, they have proven very satisfactory. If the seed is inoculated, soybeans will grow in most soils and under the same conditions as it takes to produce corn. Soybeans should be planted around the first of June on ground prepared in the same manner as for corn, in rows either wide enough to allow for cultivation on weedy land, or else drilled in the same manner as oats. A light application of acid phosphate is recommended for fertilizer. Soybean hay, cut when the pods are well formed and when cured properly, is superior to alfalfa hay in digestible protein content and has proven very satisfactory for milk production. The recommended varieties for most New York State conditions are Manchu or Black Eyebrow. The hay makes excellent winter roughage for all farm animals."

What, When, and How Much to Plant

Crop	Time to Plant	Rate of Seeding per Acre	Time to Cut
Oats and Peas...	April 1-May 10	3-4 bu.	Oats in dough stage
Soybeans	May 20-June 10	1 bu.	When pods form
Sorghum	June 1-June 15	10-15 lbs.	Seeds in early dough stage
Sudan Grass	June 1-June 25	15-20 lbs.	Seeds in early dough stage
Japanese and German Millet.	June 20-July 1	½ bu.	All millets—after blooming
Hungarian Millet	July 1-July 10		until seeds are in late milk stage.
Common Millet	July 1-July 15		

Vine. The hay should be cut when the oats are in the late milk or early dough stage since, if harvesting is delayed, there will be serious loss of both oats and peas. The mixture makes a hay that is comparable in feeding value to red clover and it appears that for most conditions, it is one of the most satisfactory emergency hay crops. If you find that you have not sown enough of the mixture, oats cut green make a satisfactory supplement."

"Yes, I have done that," said Mr. Jeffrey, "but, our Farm Bureau Agent suggested that we grow soybeans as a hay crop last year."

"Soybeans seem to be coming more and more

"I believe I will try a small piece this year" added Mr. Jeffrey, "and I have a plot of land down on the lower meadow where I had planned to put corn this year. I heard a neighbor of mine talking about sorghum the other day" continued Mr. Jeffrey. "He said he had some last year and was planning to use some this year. Would you advise sorghum rather than soybeans?"

"Well," I said, "It is a question. In most cases, I certainly would not advise sorghum in place of soybeans, as it is not as adaptable to New York conditions. However, the soil and climatic requirements are about that of corn and sorghum (Continued on Page 10)

A Horseless Potato Farm

How a Connecticut Grower Gets Big Yields On a Large Acreage

By **ALBERT E. WILKINSON**
Connecticut Horticulturist

WE are swinging fast towards horseless farming. A most striking example of the machine age was demonstrated last summer on the farm of Louis L. Grant, Buckland, Connecticut. One hundred acres of potatoes in three fields were grown from start to finish without the use of horses. On this 100 acre tract of potatoes the vines were uniform in growth, with uniform spacing of rows, and care in every particular—all presenting an object lesson of well-planned farming to farmers in any section of the country.

The largest field is approximately 55 acres. Two other smaller pieces are nearby. It is only these large stretches of land with the long rows that offer advantages to tractor farming. The only hand labor in the field was picking up the potatoes after they were power dug.

Uses Certified Seed

Mr. Grant, like other successful potato growers, has found certified seed a prime essential for worthwhile yields of potatoes in quantity and quality.

While 95 per cent disease free seed is accepted as seed sufficiently free from disease to be the foundation of good crops, Mr. Grant requires his seed to be 99 per cent free from disease. He secures this highest grade seed partly from inspection of the potatoes as they are matur-

ing in the fields in Prince Edward Island and other seed growing localities. Seed Growers, who think they have a superior growth of resisting potatoes, send him word and he and Mrs. Grant combine business and pleasure by fall inspection of the fields.

Uses Own Formula

Mr. Grant purchases his seed potatoes and fertilizer in carload lots. This year he planted about seven carloads of potatoes. He buys his fertilizer direct in most instances and mixes it according to his own formula. This work is done by his men at times when it does not interfere with outside work. The materials Mr. Grant uses are nitrate of potash, ammonium phosphate and castor pumice. The three ingredients are dumped on the concrete floor in the potato warehouse, shoveled over several times and passed through sieves to remove lumps.

Mr. Grant secures a 10-16-14 formula from the proportion in which he mixes the nitrate of potash, ammonium phosphate and castor pumice. This gives him a double strength as compared with the usual 5-8-7 formula and enables him with 1,000 pounds to the acre to obtain results equal to 2,000 pounds of a 5-8-7 formula. This concentrated fertilizer saves Mr. Grant a large amount in trucking the three component parts of his fertilizer to his farm, requires fewer bags, and less work in mixing, rebagging, carrying to the fields and sowing the fertilizer.

The seed potatoes are cut by hand, put on specially constructed cutting benches, each with a fixed knife. Fast, accurate cutting results. This work is done at the warehouse. Mr. Grant does not follow the practice of some growers and dip his potato pieces in a scab control solution, but plants the seed as it comes from the cutter. The seed purchased must be as free from scab and rhizoctonia as possible, else no sale.

The bagged fertilizer and potatoes are taken to the fields. Two rows of potatoes are planted at a time. The unit for each row it hitched to a power tractor. Each unit sows the fertilizer and drops the seed. Two disks open a trench four inches deep into which the fertilizer is sowed in two rows six inches apart. While the fertilizer is being sown, the seed pieces are fed from the hop-

A weeder similar to the one Mr. Grant uses after harrowing. It will cover forty acres a day.

Thought for the Week

HIGH up in the Rocky Mountains, on the edge of a great forest, there lived a little boy with his mother. One day, for some misbehavior, she punished him severely. And the child, in temper and rebellion, called out, "I hate you, I hate you, I hate you!" and ran away into the forest crying out, "I hate you, I hate you, I hate you!"

And he came to a great ravine with a towering cliff behind. He stopped in his flight, but trembling in his little rage, he cried again, "I hate you, I hate you, I hate you"—and an echo came back, "I hate you, I hate you, I hate you."

Now thoroughly frightened, he ran back to his mother, sobbing about the bad man in the forest who said, "I hate you."

And the mother, wise as all mothers are, led her little boy to the ravine. And she said, "Son, now cry out, 'I love you, I love you, I love you.'"

And the shrill treble of the boy's voice rang out, "I love you, I love you, I love you."

And the echo came back, clearly, sweetly, like far-off bells in a temple garden, "I love you, love you, love you."

And she said, "My son, that is the law of life. What you give, you get."

And we say to our readers, that is the law of business, of society, of all human affairs. What we give, we get. —Adapted from an old fable.

Right Principles of Taxation

MORE and more we are convinced that action must be taken immediately to stop the rising costs of government and the resulting taxation. In taking such action, the situation must be studied not to "bite off our noses to spite our faces"—that is, not to put a stop to necessary public work.

We give below some statements of tax principles drawn up by our friend, Editor Clarence Poe, of the *Progressive Farmer*, a Standard Farm Paper. Read those principles and see how many you can endorse. Read them out loud at the next Grange or local farm meeting. By the way, has your Grange a tax committee for the study of this all-important tax question?

Here are some of the principles as outlined by Mr. Poe:

1. The proper basis of taxation is income-producing power during the period when taxes are levied, this principle being subject to minor modifications hereinafter mentioned.

2. The tax burden should be carried by those persons and industries most able to bear it and that

can bear it with the least injury to themselves and the future development of the state.

3. The state should tax the gains of thrift, toil, and enterprise, less, the gains of chance, gift, or inheritance more; luxuries should bear a larger burden than necessities; unearned incomes a larger burden than earned incomes.

4. The burden of supporting policies of state government should be equitable between counties as well as between individuals.

5. The fact should be realized that visible, tangible, and immovable forms of property are by their nature likely to bear more than their just share of taxation.

6. Taxation policies should encourage and not discourage (a) thrift, (b) beauty, and (c) the conservation of natural resources. For example, the man who paints his home and beautifies his grounds should not have his taxes increased in consequence. The man who terraces and enriches his land should not be taxed more heavily than the man who allows his soil to wash away to the perpetual detriment of the state.

7. Forests and the land on which they grow should be taxed separately—the land taxed annually on the bare land value and the products taxed at the time sales are made from them instead of annually.

8. Publicity of assessments should be recognized as perhaps the best antidote to favoritism and inequality.

9. The state is increasingly contributing to schools and roads and other purposes once regarded as local. This justifies and necessitates such effective state supervision of assessments as will constantly insure an equitable distribution both of benefits and burdens.

10. To reduce tax burdens and yet not set back the agencies of modern civilization (such as educational, health, agricultural, and welfare work), men and women citizens must more earnestly study all plans for efficiency and economy in government, notably the consolidation of counties or county functions; city and county managers or commissions; stricter regulations of bond issues and taxation; better safeguarding of public funds; and the adoption of well considered standards of efficiency for all forms of public service.

Do You Want Compulsory Automobile Insurance?

"I have what I believe a very important subject for your readers' consideration and one that has been agitated considerably.

Should Automobile insurance be compulsory and why?

How are you going to collect claims under \$50.00 if accident occurs some distance from your home, without costing more than the claims? Insurance seems all right in principle, but practically worthless in these minor cases, in which class, most are listed. I am sure insurance companies are like individuals, not wishing to pay more than is absolutely necessary.

Nearly all of us have carried auto insurance for years and would like to feel that it is some good. I would like to hear from others and I would like to state some of my experiences in such cases."—M.E.S.

THERE is something in human nature, and particularly in Americans that objects to compulsory laws. There is a lot to be said for compulsory insurance and it has been argued in the legislature, but whether its benefits would outbalance its dangers we are not so sure. We would be glad to hear from our readers on this subject.

Do Farmers Use Much Milk?

THERE is some question about how much milk and other dairy products farmers consume. We have been trying to find the facts. R. L. Gillett, Agricultural Statistician for the New York State Department of Agriculture and Markets and the United States Department of Agriculture, answered our question as follows:

"Our estimates indicate a consumption on farms equivalent to 1,032 quarts per family per year, or 2.8 quarts per day. Farm families apparently average between four and five persons per family. This is for all kinds of farms. A survey of 891 dairy farms showed a much larger consumption per capita at the rate of 4.2 quarts per family and .86 quarts per capita."

These figures would indicate that farmers consume a little more milk per capita than city folk. Of course they should.

Consumption in the New York Metropolitan area has shown a constant increase each year over the preceding year, but in 1930 instead of showing an increase of 3,000 cans per day over

last year, which has been the usual gain, fluid milk consumption fell off 7,000 cans per day making a total decrease, if one counts the normal increase, of 10,000 cans over what might have been expected in a normal year.

This decrease of consumption is exceedingly unfortunate both for consumers and producers. There are those who say that it would greatly help if milk prices were lower to consumers. We do not believe a lower price would have much effect upon the consumption unless the price came down several cents a quart. A small reduction is not enough, and when the reduction is small the dealers seem to have a habit of passing it all on to the farmers.

Coming back to the question of milk consumption on farms, it is good to note that farmers do patronize their own industry, but of course consumption per capita is not yet anything to boast of. If every farm family would increase their consumption during these surplus times two quarts more a day, it would have a material effect on the whole milk situation, and the nice thing about it would be that the additional milk thus used in the farm family would benefit every member.

Blocking Side Roads By Snow Removal

WE are getting any number of letters from farmers living on dirt roads who complain that snow removal operations on the main roads are blocking the entrances to the side roads. We do not blame these farmers for being irritated. Not only must they, in many cases, contend with snow themselves on their own roads without any help from the officials, but more than this, after they have succeeded in getting through to the main road, they find huge, packed drifts across the entrances placed there by snow removal machinery.

Unfortunately, we know of no remedy by law for this situation. The only thing we can suggest is a friendly talk between those who live on these dirt roads and who have had this trouble and the road officials responsible for snow removal. A good many times, the blocking of these side roads is unintentional. Possibly bringing it to the attention of the highway superintendents or to the local supervisor may help correct the situation.

It seems to us that the town boards might well be on guard to protect the interests of dirt roads farmers in their towns in this matter.

Neither an Optimist Nor a Pessimist

"Since pessimism does not raise the price of wheat and optimism will not put a pair of shoes on the baby's feet, let's lay both of these gentlemen upon the shelf."—J.G.G.

THE above statement from our friend is just a clever way of stating one of Dr. G. F. Warren's cures for hard times. Dr. Warren is, you know, head of the Economics Department of the New York State College of Agriculture, and one of the most brilliant and sensible leaders of agricultural thought. He says that what we need is to be more pessimistic in good times, and more optimistic in times of depression. In other words, if we humans could only learn to keep in the middle of the road and never go to extremes, how much happier we would be.

Eastman's Chestnut

"SHUT the door," yelled the rough man. "Where were you raised—in a barn?" The man addressed complied, but the speaker, looking at him a moment later, observed that he was in tears. Going over to the victim, he apologized.

"Oh, come," he said soothingly, "you shouldn't take it to heart because I asked if you were raised in a barn."

"That's it, that's it," sobbed the other man. "I was raised in a barn, and it makes me homesick every time I hear a jackass bray."

UNDER FROZEN STARS

By George Marsh

CHAPTER I

"SMOKE, OLD CHUM, there's something adrift out there to the south." Ears pricked, the massive black-and-white husky raised slant eyes to the speaker, while his heavy coat and plume of a curved tail fluttered in the driving wind which beat across the great lake.

Shading his eyes with a brown hand, Jim Stuart watched a distant object,

Do Not Miss the First Installment

ON this page is the first installment of "Under Frozen Stars", a thrilling story of action in the Canadian woods. It was written by George Marsh, the author of "The Valley of Voices" which many of you remember. We assure you that if you will read this installment this week that you will look forward eagerly for the rest of the story.

which regularly disappeared, to lift again on the white crest of the running seas.

"Acts like a filled canoe, Smoke. I'm going to get the glasses."

Stuart left the shore where the breaking seas, driven across ten miles of open lake by the southwest gale, pounded, edging the beach with foam. Crossing the clearing, where the grass grew thickly among the stumps, to the group of white-washed log buildings of the little fur post, he entered the tradehouse.

"Looks like a capsized canoe out there, Omar," Stuart said to the broad-backed figure seated cross-legged on the floor, shaping with a draw-knife a slab of birch into a paddle.

The half-breed lifted a swart, square face, seamed with lines, his mouth widening to a grin, as he said: "Wal, w'at you do? Dis cano' come from Nor'-Wes' Companee; eet ees good t'ing, eh?"

"You're too bitter, Omar," said the factor of Sunset House. "We can't let men drown before our eyes even if they are from LeBlond's. Anyway, I couldn't make out anyone hanging to her. She may have drifted away empty. I'll take a look with the glasses."

Stuart took his service binoculars from the case where they hung on a moose-horn gun-rack and joined the dog who waited for him at the door. Crossing the clearing to the shore, he focus-

ed the glasses on the wind-harried lake. As he found the drifting object he sought, his lips moved in a muttered: "Man hanging to that boat! How long can he last?"

To the Rescue

Jim started on a run for the tradehouse. "Come on, Omar! There's someone with that filled canoe. He's drifted miles—probably half-drowned already, the way they're rolling over him!"

The stolid half-breed dropped knife and paddle and, taking the glasses from his chief, stepped outside.

"There, about two miles off-shore!" said Jim, pointing to the submerged canoe.

Slowly the black head of Omar nodded. "Boy wid dat cano'," he said. "He get long ride—from LeBlond's."

"Come on! We'll take the Peterboro!"

The lined face of the half-breed stiffened in a black frown. "We fill, too, out dere! Tough job—put de cano' into dat wind!"

Stuart laughed as he started for the shore, followed reluctantly by his man. "What! The best canoe-man I ever saw

—afraid of that water?" he taunted. "You sure hate that LeBlond outfit! But we'll show this fellow some paddling!"

Turning over the Peterboro on the beach, the two men waded with her into the surf, and leaping in, drove the craft into the rolling combers which broke on her bow. Beside them plunged the excited husky. "Back, Smoke! Back!" shouted Jim, and the great dog returned to the beach where he yelped out his chagrin.

Out into the welter of wind-driven seas went the plunging canoe. Free of the shore, the kneeling stern-man eased the nose of the canoe off the wind, quartering into the breaking crests of the seas, in a long reach. For a mile, the dogged "churn-swish, churn-swish" of maple blades fought the fury of the south-wester. In silence, half-breed and white man pitted back and shoulder and arm against the blind violence which whipped their faces with spray, seeking to sweep them back to the boulders of the shore where leaping waves burst into cascades of foam.

On they went for a space, then swung towards the submerged boat. It was grinding toil for the men who drove the plunging canoe into a wind which cut the foaming tops from the combers—quartering into seas threatening to fill the boat; fighting for every yard. The canoes were within short rifle shot of each other when Jim saw the dark head beside the submerged craft move as if to signal the approaching boat.

"He's all right!" panted Stuart. "He'll hang on! A boy!"

A Girl

Rails awash, the filled canoe bore down on the laboring Peterboro. As the rescuing boat worked closer a huge comber mounded over the wallowing craft burying the dark head beside it. Jim dug desperately with his paddle,

fearful of what the lifting boat would reveal. But as the canoe rose he saw the head still there, with the arms circling a thwart.

"Good boy!" muttered the bowman.

Closer crept the Peterboro. Again the boat was drowned in a ridge of black water, topped with foam. Then, as the dark head appeared, the eyes of the toiling bowman widened in amazement.

"A girl!"

His paddle tore at the water. "A girl! Game to the marrow—the way she hangs to that boat!"

Over his shoulder he shouted: "It's a girl!"

It was dangerous work—edging the Peterboro alongside a filled boat yawing in that sea. But Omar Boisvert was a magician with a paddle, and did not hesitate. As they reached the canoe the half-drowned girl turned a face grey from exhaustion and the drenching of the seas, and her blue lips moved.

While Omar fought to hold his bow into the wind against the drag of the yawing canoe, Stuart worked desperately to get the limp body of the girl into the boat without rolling them under a lifting sea. At last, she was in the Peterboro, and, as a ridge of water broke at the bow, they cleared the boat and headed for Sunset House.

"A white girl—from LeBlond's! Short hair, whipcord knickers—who can she be?" wondered Jim as his stiff arms drove his paddle. He glanced over his shoulder at the huddled figure of his drenched passenger covered by his coat. "Cold?" he shouted to the shivering girl. "Get down, out of the wind!"

She nodded, with a gallant attempt at a smile, as he encouraged: "Only a few minutes now!"

"Wet as a beaver," he thought. "She's plucky all right—must be half-frozen in this wind, but there's nothing to do but run for it. We'll soon reach the beach and Omar's wife'll dry her out. Game enough to grin between shivers—and what teeth!"

But two miles of running "white horses" separated the canoe, yawing in the following sea, from the post, and the kneeling bowman had his work cut out.

At length, leaping into the shoal water, Stuart eased the boat in to the beach at the post; then lifted the girl, blue with cold, from the boat.

"Can you walk?" he asked, conscious of the thickness of her drenched, crow-black hair. "Take my arm."

Marthe Disapproves

The girl's stiff legs, numb from exposure to water and wind, moved uncertainly. With a shrug she raised black eyes to the man who supported her, wondering if he dared pick her up and run to the warm kitchen of Omar's cabin. "I make you—much trouble," she replied through chattering teeth. "You take me—out of—that wet lake. Now you must—dry me."

They laughed together as the lean, young fur trader supported the shivering girl who wore his coat, while moisture from her hair stood in beads on her heavy brows and lashes.

At the door of her cabin the amazed Marthe, wife of Omar, met them with wide and disapproving eyes. Jim Stuart with a short-haired girl wearing a man's coat, a man's trousers, a man's

The Song of the Lazy Farmer

MY NEIGHBOR says as sure as fate us farmers must cooperate, a-selling singly we are lost, we can't git what our products cost. If we will try it once or twice we'll find the way to git a price is band together when we sell; and if it takes us quite a spell to git lined up and organize, that's what we'll do if we are wise. Them buyers all are shrewd and they just work together ev'ry day, they know just what they want and so they buy our products pretty low. This market problem ain't no joke, and if we'd keep from goin' broke, we'll git together, man to man, and show the whole world that we can sell off our crops ourselves, and we will git a decent price, by gee.

My neighbor's plan sounds pretty good, and if we'd organize we could just have the market by the tail and make a profit on each sale. The trouble is, too many men just git right in and out again, they stick tight when the price is dear, and

when it's low they disappear and sell their stuff some other where, co-ops can bust for all they care. A co-op can't git in its licks unless each member sticks and sticks, we've got to fight for what we git, the battle's lost if fellers quit and go and leave it now and then with burdens on the other men. Our human nature must be changed before our plans can be arranged, if we would rule the markets, we must stick right to the end, by gee!

Would not plant seed corn without it

"After the crows took nearly every stalk last season I used Stanley's Crow Repellent," writes R. O. Miller, Lucas, Iowa. "This season they did not take a stalk." "Keeps moles away," reports Chris Redding, Streator, Ill. Also gophers, and other seed corn enemies. Non-poisonous. Can not clog planter, wet or dry.

Large size can for 2 bu. seed corn (8 to 10 acres), \$1.50. Small can \$1.00. If your hardware, drug store or seed store doesn't carry "Stanley's," order from The Cedar Hill Formulae Co., Box 500-M, New Britain, Conn. Money Back Guarantee.

A.A.'s Western New York Farm and Home Talk

Ready for Spring's Work

By M. C. BURRITT

IT is raining! It has been raining for twelve hours and more and water is accumulating in the lower flats. The creeks are running full to their banks. Even the ditches by the road and in the draws through the fields are full of water. Puddles are everywhere and my boots suck as I walk over the land and pull my feet out of the mud. It is a good, wet, soaking rain. I hear it pouring in the cistern as I sit at my farm desk writing this and it gives me a feeling of pleasure and deep satisfaction. It can still rain—the good hard, old-fashioned kind of rain and I am reassured, for it has been almost a year since we have had this kind of a rain—and how we needed it!

Spring is in the air. Except for here and there a snow bank in a fence corner or on the north side of buildings or trees the big snow is gone. The robins and bluebirds are here in considerable numbers. The smell of burning brush is in the air. There are signs of stir among men as well as nature. Here and there in my travels during the week, on warm well drained locations, I have seen a man plowing and another spading in his garden. Soon we shall be back in the rush of preparation and planting again. It won't be long now.

the good hard, old-fashioned kind of rain and I am reassured, for it has been almost a year since we have had this kind of a rain—and how we needed it!

Spring is in the air. Except for here and there a snow bank in a fence corner or on the north side of buildings or trees the big snow is gone. The robins and bluebirds are here in considerable numbers. The smell of burning brush is in the air. There are signs of stir among men as well as nature. Here and there in my travels during the week, on warm well drained locations, I have seen a man plowing and another spading in his garden. Soon we shall be back in the rush of preparation and planting again. It won't be long now.

A Home Made Brush Burner

Well, we are ready. The pruning which we have been working at since December last is done and the brush burned. The boys built a brush burner out of old lime-sulphur barrels at a cost of less than one dollar cash and they cut the barrels up and down and spread them out. Slits about eighteen inches long and six inches apart were cut crosswise in the bottom sides for air and to let the ashes fall through. These split barrels were then fastened to gas pipes on either side which were in turn mounted about a foot above pole runners to prevent burning the wood parts. The team was then hitched well ahead with a log chain, and that's all there is to it. The outfit saved some time and the job was a whole lot easier than hauling on a stoneboat to piles for burning there.

Peaches were sprayed for leaf curl during the past week. As this was before the rain no trouble was experienced with soft ground which was surprisingly firm for this time of year. The peach buds on the three year trees look pretty well. They will blossom lightly. Apple buds are generally strong, and except where they bore heavily last year they will apparently bloom well. Baldwins especially give promise of good bloom. In a walk over the orchard today I gathered a bunch of twigs from all varieties which are now in a jar of water in the south window of

the house to check up on bud conditions. No doubt hundreds of other growers have already done the same.

The month of March with its blanket of snow has been almost ideal for wheat and seedings. There was little frost when the heavy snow came and covered the ground deeply for two to three weeks and has just disappeared with the present warm rain. So grain and seedings have escaped almost entirely the usual freezing and thawing, resulting in heaving, which has caused so much damage in the last year or two. Of course, there is time for this yet in April, but we are safely through one bad month.

We Stay in the Poultry Business

My son to whom I have now turned over the entire poultry enterprise, has the brooder houses ready for the first batch of chicks tomorrow. Egg prices have been the lowest I can remember all winter long and are most discouraging. But it is not the time to quit now. We must utilize our equipment. Feed is cheap. Many egg producers are certain to quit the business as a result of low prices and next Fall ought to witness some revival of prices. We want to be ready to take advantage of that situation so we shall raise the usual number of chicks.—Hilton, N. Y., March 29, 1931.

Home Orchard Management

I would like some information in regard to apple trees. When should they be set out? What age should the tree be set? What variety should we grow and how should they be pruned?

YOUR particular condition will govern to some extent the answers to your rather general questions. As to varieties, I would suggest that you follow the practice of your neighbors. They have had experience with your conditions and know what is best adapted. MacIntosh is replacing Baldwin in many of our central New York orchards. The State College at Ithaca has a new bulletin on apple varieties which they will be glad to send to you free of charge.

As to the age of tree to set, it rests

between a one year whip or a two year tree. It is probably better to set a whip since it has no side branches and the grower may select the desirable limbs as they come out and pinch off the others. The tree wastes no energy in building wood which has to be cut off later. It is advisable to space the limbs so that weak crotches and future splitting is prevented. Rapid growth enables the whips to soon catch up with older trees.

The best time of planting varies a little, but as early in the spring as possible after the frost is out, seems to be the best practice. The ground should be tamped firmly about the roots and cultivation started immediately. Cultivation will secure rapid spring growth and a cover crop planted in the

(Continued on Opposite Page)

"The Wise Farmer"

There was a man in our town
And he was wondrous wise
He knew that if he wanted crops
He'd have to fertilize.

It's nitrogen that makes things green

Said this man of active brain:

And potash makes the good strong straw,

And phosphate plumps the grain.

But it's clearly wrong to waste plant food

On a wet and soggy field;

I'll surely have to put in drains

If I'd increase the yield.

And after I have drained the land

I must plow it deep all over;

And even then I'll not succeed,

Unless it will grow clover.

Now acid soils will not produce

A clover sod that's prime;

So if I have a sour soil,

I'll have to put on lime.

And after doing all these things,

To make success more sure,

I'll try my very best to keep

From wasting the manure.

So I'll drain, and lime, and cultivate,

With all that that implies;

And when I've done that thoroughly

I'll manure and fertilize.

—DEAN ALFRED VIVIAN,
Ohio State University

FARMEX FACTS

The first successful gas traction engine was completed in 1901 by C. W. Hart and C. H. Parr in Charles City, Iowa . . . In 1905 Hart developed his kerosene burning carburetor—an outstanding step in helping farmers lower their production costs. In 1907 these men also coined the term "Tractor" which today is used universally to designate these machines.

FARMEX**EXPLOSIVES**

With the advent of the tractor, the need for fields free from stumps, boulders and other obstructions became apparent and the value of explosives for such work was recognized. . . . Today Farmex Explosives are made in different grades each one for a certain kind of farm work. Write for particulars.

(Continued from Opposite Page)

summer will induce maturing of tissue and provide organic matter to be turned under the following spring.

As to pruning, the tendency seems to be toward a modified leader type of training system. This system provides bearing capacity by combining the spreading of the open center type with the use of the top as in the leader type. The center is well-shaded to prevent sunscald and an injured limb can be removed without ruining the shape or balance of the tree. It seems to provide a satisfactory bearing surface and the proper distribution of limbs to enable economical spraying and harvesting.

Leafy Spurge, a New Weed

L EAFY spurge is now in eleven New York State counties. It reproduces by seeds and by the creeping roots. It is estimated that a piece of root, one-half inch long is capable of developing into a new plant if left in contact with moist soil. Small pieces of root dragged from one field to another by farm machinery will spread this weed all over the farm.

Any attempt at eradication must aim at the destruction of the root. Salt is ineffective unless used in such quantities that the soil becomes sterile for quite a while. Smothering with straw or paper has been tried but is ineffective. Pasturing with sheep for three or more years and fallowing the ground have been found to be effective in some instances.

Seeding Sweet Clover in Corn

"If I should broadcast sweet clover in the corn at the last cultivation, would I have a suitable field for pasture next summer? We always get a good catch of alfalfa in the fields and last year we put sweet clover in the orchards in June with a big stand there now. My farm is located here in northwestern Wayne County. I need the pasture. How much would you advise sowing per acre?"—W.L.C., N.Y.

T HE limiting factor is usually moisture. In moist sections of the state or in times of well distributed rainfall, a good catch is sometimes gotten but the practice is not one that we generally recommend. It is my observation that two out of three seedings of sweet clover made in corn have failed. I, personally, had one experience on a farm southeast of Syracuse. Conditions there were similar to conditions in your locality. We had no trouble in getting alfalfa in the regular way. However, the sweet clover sown at the time of last cultivation did not get well enough established to enable it to survive the winter.

I hate to write a letter that is a "wet blanket" and yet I cannot conscientiously do otherwise. If you try it, do so with the understanding that you are gambling. The enclosed leaflet on sweet clover may help. Sow 18 or 20 pounds of scarified biennial white blossom sweet clover to the acre.—H. B. HARTWIG.

The Cabbage Aphid

Our cabbages are covered in spots by small green insects that are about the same color of the cabbage leaves. Will they kill the cabbages and how can we control them?—J. K., New York.

T HE insect that is infesting your cabbages is undoubtedly the cabbage aphid or plant louse. This insect has sucking mouthparts and so cannot be poisoned. It injures the plant by sucking the juice from the leaves. It probably will not get so thick as to kill the cabbages.

The insect can be controlled by dusting with nicotine sulfate at the rate of 5 pounds mixed with 95 pounds of hydrated lime. Better control will be secured if dusting is begun before the insects get too thick.

Make a rock garden of that irregular slope which has a tendency to wash badly. Place rocks firmly, leaving deep earth pockets between. The earth should consist of loam, leaf mould, crumbled mortar, and some sand thoroughly mixed.

SIXTY-TWO TEST MILES PROVE**New**
dip treatment
BETTER for seed potatoes

In a test, Improved Semesan Bel increased the yield 19 sacks or 31 bushels per acre.

Old, mussy "two-hour" soak treatments have had their day. Now there's a brand-new way to treat seed potatoes! Proved effective by 62 miles of tests in 18 different states. Costs as little as 1½¢ per bushel of seed. And so quickly applied that one man alone can treat 300 to 400 bushels of seed per day!

Just Dip and Plant

With Improved Semesan Bel, all you do is dip your seed and plant. Yet this quick treatment controls seed-borne scab and Rhizoctonia fully as well as time-wasting corrosive sublimate or formaldehyde soak treatments. In addition, it prevents seed rotting; produces stronger and more uniform field stands, and gives you a bigger, better and more profitable potato yield per acre.

**Bigger Potato Yields**

In tests during the past year, many practical growers obtained yield increases ranging from 13% to 20% by treating their seed with Improved Semesan Bel.

Makes Good Seed Better

Even certified seed often carries some disease organisms. That is why all seed should be treated with Improved Semesan Bel. One pound treats 70 to 80 bushels, so you can treat seed for only 1½¢ to 3¢ per bushel. Ask your regular dealer for pamphlet, or mail a card to Bayer-Semesan Co., Inc., Dept. 63, 105 Hudson St., New York, N. Y.

TWO COWS MAY LOOK ALIKE, BUT— THE RECORD OF PRODUCTION Tells The True Value

Half-blood Holstein. Average production 6955 lbs. milk; 266 lbs. of fat.

Here is a "boarder" cow. She isn't backed by the breeding that promotes profitable production. She would cost less to buy, but her poor production would mean low milk profits.

Three-quarter blood Holstein. Average production 13366 lbs. milk; 498 lbs. of fat.

This cow is a profitable producer. She looks much like the "boarder" cow, but costs no more to feed and keep. Yet her yearly production is over 13000 lbs. of milk. This cow is a money-maker.

Two brands of agricultural limestone, like the two cows, may look alike, but it's the record of production that tells the true value. The degree of purity, fineness, and the speed of solubility are the characteristics of every liming material which determine its value in your soil.

USE MICHIGAN LIMESTONE

Consistent Producer of Profitable Results

With a firmly established record for getting results and improving soils and crops, MICHIGAN LIMESTONE is the choice of thinking farmers year after year—farmers who buy with confidence, knowing that MICHIGAN LIMESTONE will never fail to maintain its high reputation for producing profitable returns.

Lower grade limestones may sell for cheaper prices. But profit from liming depends on favorable results. The use of MICHIGAN LIMESTONE insures results that will make money for you.

Buy your liming material on the basis of Purity and Solubility. With its high Calcium analysis, MICHIGAN LIMESTONE combines great purity with a soft, easily dissolved texture. The Cavanaugh Solubility Test shows MICHIGAN LIMESTONE to have extremely rapid solubility, which makes it quicker to bring results and quickest to make you a liming profit.

A Horseless Potato Farm

(Continued from Page 3)

per spout exactly in the center between the rows of fertilizer, so that each seed piece is three inches away from the fertilizer. A seed piece is dropped every fourteen inches. In the rear of each unit are disks which cover the fertilizer and seed two inches deep.

This method of placing the fertilizer and seed on the same level has been found better, Mr. Grant says, than the customary way of covering the fertilizer with a layer of soil and then dropping the potato on the soil.

Ten days after planting the fields are harrowed with a twenty-foot spike tooth harrow, drawn by a tractor, to kill small weeds and loosen the soil. When the potatoes begin to appear and are about two inches high, tractor-drawn machines are used to bury the potatoes about six inches deep.

Burying Young Plants

This "burying" of the young potatoes though it might seem injurious to one unfamiliar with farming, is really beneficial. When the shoots break through the ground again they are better established for their life work because of increased root development.

As soon as the potato plants show plainly, that is, from one to two inches tall, the tractor-drawn weeder is employed to loosen the soil between the rows and kill weeds.

Spraying begins about June 25. Questioned as to how many times he sprayed, Mr. Grant said "nine or ten times, just as often as we can find time to run the sprayer." He says the repeated spraying increases the resistance of the leaves to disease.

Bordeaux mixture is the spray used by Mr. Grant with the addition of six pounds of calcium arsenate to each 100 gallons of Bordeaux in the first spray to kill the Colorado beetle ("potato bugs"). If aphids (plant lice) threaten one and a half pints of Black Leaf Forty (a tobacco extract) is added to each 100 gallons of Bordeaux mixture.

Eight rows are sprayed at a time. The pump has a pressure of 400 pounds and the spray mist is directed with great force against the vines and also under the leaves.

Has Huge Warehouse

A few years ago Mr. Grant built a large warehouse near his residence for the storage and marketing of his large potato crop. The warehouse is 120 feet long and 54 feet wide. It is built against a side hill and there is an entrance at grade to the second floor.

There are 54 bins in the warehouse, the bins being on both sides of central alleys. The lower runway is of concrete, and on this runway Mr. Grant sorts and bags the potatoes when sold, and in the spring mixes the fertilizer.

Under the two rows of bins on the lower floor the earth is exposed and every bin on the two floors is exposed to air on all four sides. Each bin will hold about 750 bushels, and the capacity of the warehouse is 40,000 bushels. On the lower floor of the warehouse is a heating plant from which heat can be conveyed to the second floor. The heat is not used unless a prolonged spell of damp weather should cause the potatoes to sweat. Should this occur, Mr. Grant opens the upper door, though the weather be down to zero and drives out the damp air. As the bagged potatoes are brought to the warehouse they are dumped into bins which are left uncovered.

Mr. Grant finds the best way is to leave the potatoes in the bins until he has orders. Then, as the potatoes are bagged, it is easy to detect bruised and imperfect potatoes, and throw them away. The potatoes are sorted on machines operated by electricity, and, as they pass over the wire mesh, drop through according to size into bags.

Weed Control

Mr. Grant has found that he can secure the best crop if he plants his potatoes during the middle of May. In planting, a tractor drew a two-row planter, one man driving the tractor and one man on each planter to see that the potatoes were properly deposited in each slot of the machine.

With this outfit six acres were planted each day. The rows were 34 inches apart and the seed pieces were dropped 14 inches apart.

The next operation after planting is harrowing. Mr. Grant has had a special harrow built. It is 20 feet wide and of the spike tooth type. The entire acreage is harrowed over once, working the field the way the rows were planted. Forty acres per day were covered with this harrow. A week or ten days after harrowing the tractors were used to draw an especially constructed weeder. This weeder is 17 feet 8 inches wide and has 71 teeth.

Cultivation with the tractor is not new but is not in any way common, particularly in Connecticut. Two rows were cultivated at a time, the potatoes being buried as already mentioned. Only three cultivations were given. The shovel teeth were used the last time to ridge the potatoes somewhat. It has been found this year that from 16 to 16½ acres could be efficiently cultivated in a ten-hour day.

One of the big points is the way that Mr. Grant sprayed to prevent insect and disease destruction. It has been thought by many growers that a tractor would injure the tops so much that the yield would be lessened. Mr. Grant has proved this not to be so, as his fields last year, a dry year, averaged him 400 bushels or slightly better. A portion of the field where the soil was relatively moist gave over 600 bushels per acre. Mr. Grant used a tractor to draw his large eight-row sprayer. The sprayer has three nozzles per row and spraying at a pressure of 400 pounds. On an average, 25 acres per day are sprayed with one machine, tractor drawn. On the 55-acre piece from 30 to 32 acres per day could be sprayed. This is due to the fact that the rows are much longer, and therefore require much less turning of the machinery.

In digging Mr. Grant used a tractor and two diggers in one gang. These diggers are of the largest size, the apron being 36 inches wide and of extra length. The power for the apron is derived through a take-off from the tractor. Two rows are dug at a time. It is easy to dig from six to seven acres per day. This requires a large force of men in order to pick up the potatoes.

In addition to this field Mr. Grant has 90 acres near his home. A portion of the work on this 90-acres has been done by tractors; namely, the plowing and the harrowing. The cultivating and spraying have been done with horse-drawn tools.

Mr. Grant is enthusiastic over his success with power farming. This year, according to his present ideas, his entire acreage will be managed entirely by power.

Bulletin on School Grounds

THE new bulletin prepared by Professor D. J. Bushey of the New York State College of Agriculture gives pictures and plans of school grounds with diagrams for the laying out of athletic fields, for foot ball and track, for a baseball diamond, basket ball court, tennis court, for volley ball and for other sports. It also gives valuable suggestions as to the manner in which the school grounds may be beautified by plantings. This bulletin is free to residents of New York state and may be obtained from the mailing room of the New York state college of agriculture at Ithaca, N. Y. Ask for bulletin No. E-194.

The number of years that the Papec Ensilage Cutter has been on the market is brought to attention by the fact that the Papec Machine Company is distributing its thirty-first annual Ensilage Cutter catalog.

This is a particularly handsome book with a 4-color process cover and with the several different sizes and types of cutters reproduced in colors. It contains interesting facts and figures showing how largely the use of silage increases profits from dairy cows, beef cows, calves and lambs. Any feeder can have a copy of this new catalog by addressing the Papec Machine Company, Shortsville, N. Y.

Seeing Is Sometimes Hard Believing

(Continued from First Page)

we have only scratched the surface of the radio's possibilities. Radio is still much of a mystery.

Leaving the broadcasting studios, we started on a trip through the main avenue of the General Electric Works. This avenue is a mile and a half long, and lined on either side with mammoth manufacturing buildings all devoted to the business of making electrical apparatus.

Take Care of Sick and Injured

Personally, I am, of course, interested in machines, but to me people are the most interesting of all, so when we came to the General Electric Hospital and Dispensary, it was good to know that this large employer of men (the Company has 20,000 employees on its payroll) thinks enough of its personnel to maintain one of the most complete hospitals and emergency outfits of any industrial concern in America. In the early days of manufacturing in this country, laboring conditions were cruel and hard. For example, all middle-aged country people can remember conditions in the old tanneries. The hours were long, the pay was poor, and compensation insurance, carefully-guarded machinery, and adequately-equipped hospitals in manufacturing plants as we know them today were unknown a few short years ago.

Did you ever stop to think where all of the thousands of miles of wire comes from that is used in telephone, telegraph, and electrical transmission service? A lot of it is made by the General Electric Company, and our Master Farmer party saw where it was done.

But I think most of the Master Farmers and their wives in the party will agree that so far as the different manufacturing departments of the General Electric Works are concerned, the electric refrigerator department is the most interesting. It is rather strange, is it not, when you stop to think about it that man has made a machine that will freeze better and purer ice than nature itself. There are several large refrigerator manufacturers in the country, as you know, and after visiting the place where these are made at the General Electric Company, I am convinced that the old-fashioned ice houses and the inefficient peddling of ice in the cities are doomed. Milk cooling on every farm by refrigeration is not far away.

Where Seeing Is Not Believing

I have saved a description of the most interesting part of the visit to the General Electric Works, however, until the last. Everybody has heard of the famous Steinmetz Laboratory, often called the "House of Magic." For over an hour our Master Farmer party sat in the E. W. Rice Auditorium of the General Electric plant and listened to and watched the wizards of the "House of Magic" explain its wonders. Demonstrations were shown to illustrate what the scientists have done to increase efficiency in the production of electric lights. The first Edison light was not very much stronger than a good oil lamp, but since its invention scientists

have been constantly busy to improve the efficiency of the light.

Possibly the most interesting phenomena in the world are the different kinds of waves, such as light waves, sound waves, radio waves, short waves, long waves, and so on. Waves are the result of vibrations, and much of the development of modern science has come through a better understanding of vibrations and the resulting waves.

Under the control of the demonstrating scientist, waves were made to travel through space and light lights and ring bells. We saw a practical application of this with a burglar alarm. We saw waves light up vacuum tubes at some distance from the source.

Probably light is the fastest traveling phenomenon known to man. Yet our party was treated to a demonstration whereby light was actually frozen and then thawed out under our very eyes. White balls and black balls were graded, the selection being made entirely on the basis of the color of the ball. The operator explained that the machine would grade beans in the same way.

Liquid air is magic stuff. It is ordinary air treated to such low temperatures that it actually freezes. If confined when it thaws, it expands so rapidly that a small amount of it will blow up a large building.

How "Talkies" Are Made

Turning again to the application of waves to modern science, we saw a sound picture showing Walter Damrosch, the musician, record one of his compositions on a "talkie." The sound film uses light waves for pictures and sound waves to record sound on the edge of the film.

There is not much use in my trying to describe these demonstrations, for even after seeing them it is hard to understand how they are done. As I sat with our party in the "House of Magic" watching and listening, I thought of the old story of Salem witchcraft and how not so many years ago, as history measures time, our forefathers burned people at the stake for witchcraft. Then I wondered what would happen to some of these modern research scientists if they had lived in Salem Township in 1692. What would any of those same forefathers of ours think if they could have been with our party of Master Farmers and watched demonstrations of the wonders of modern science? What would any man who lived even a hundred years ago think if he could come to life, live for a week now, and see the modern automobile, the telephone and telegraph, the electric lights, and all the other results of the work of scientists? The old boy would certainly think he had a bad case of delirium tremens!

What Will the Future Be?

Just as those who lived a hundred years ago seem behind the times to us, so will our times seem to our children's children. Just a few minutes in a laboratory like that at Schenectady is all one needs to set his imagination to work on the wonders that the future will bring forth. We have just scratched the surface. Think what will happen when a real storage battery is discovered. Imagine this world of ours when a simple way is found to turn sunlight into electricity. Soon we shall be able to throw away stoves and furnaces and heat our homes by turning a switch.

After an hour spent in this Research Laboratory our party was conducted to the General Electric office restaurant where as guests of the Company we did full justice with farm appetites to a good dinner. After lunch another interesting talk was given by Dr. Willis R. Whitney, Vice President of the General Electric Company and Director of General Electric research work. Promptly at 1:15 big buses carried the party to Albany where we soon found places in the visitors' gallery to watch the New York State Senate at work. The Master Farmers were much

Participating Policies On Automobile Insurance Are Popular With New York State Farmers

OUR net premiums last year increased 33½% over 1929. Farmers appreciate their opportunity to buy *Automobile Insurance on a profit-sharing basis*. This participating plan appeals to them strongly, probably because so many are members of cooperative organizations.

We allow 10% off "conference manual" rates as outright deduction when premium is paid. This is \$3.00 to \$10.00, depending on make and size of car or truck.

Also 10% additional deduction where policyholder has had no automobile accident during past 24 months.

This is a New York State Company, with Home Office in Buffalo, with Claims Service Branches throughout State, and claims representatives from coast to coast.

HOME OFFICE: BUFFALO, N. Y.

Write for rates and exact savings on your car and truck. Ask for Agency Proposition, if you think you would like to represent the "GUARDIAN." You may be in a good territory which is still open.

Don't let horses suffer . . . Reach for ABSORBINE

For 38 years farmers have relied on Absorbine, when strains and sprains threaten lameness. Brings quick relief to sore, swollen tendons and muscles. Aids healing of ugly gashes, sores. No blisters, no lost hair, no lay-ups. Famous for economy. \$2.50 a bottle—all druggists. W. F. Young, Inc., 579 Lyman St., Springfield, Mass.

Breed Herd Testing in New York

NEW YORK breeders of dairy cattle are showing an increasing interest in testing under the herd test plan. During 1930 the number of breeders testing under the herd test plan increased from 38 to 54 and the number of cows increased from 968 to 1315. At the present time the number of herds and cows being tested under the supervision of the New York State College of Agriculture are as follows:

Breed	No. Breeders	No. Cows
Ayrshire	20	597
Holstein	24	538
Jersey	5	99
Guernsey	5	81

A number of Ayrshire herds in addition to those given above are being tested under the supervision of the New York State School of Agriculture at Alfred.

Keeps the Cost Down

The herd test is conducted under rules that insure a high degree of integrity and at the same time keep the cost down to a minimum. The tests are conducted the same as are dairy herd improvement association tests with the exception that only two cows may be milked at one time, that the number of milkings that may be supervised in any one day are limited to 40 or 48 depending on the breed, and that each milking must be weighed and tested separately for butterfat.

Members of dairy herd improvement associations may have their regular association tester do their testing if he meets with the approval of the supervisor of advanced registry testing at the New York State College of Agriculture. Surprise tests are made by other testers when a Breed Association deems it advisable and retests are made on cows that produce above a certain amount of butterfat in any regular monthly test.

Breeders who are not in dairy herd improvement associations may test under the herd test plan through the use of advanced register supervisors at a slightly higher cost.

Certainly a great many more New York breeders should be making herd tests. A constructive breeding program requires a knowledge of the producing ability of each individual cow in the herd, that can only come from keeping records of production on the entire herd. The best proof of a sire's ability to transmit production is obtained only when the producing ability of all of his daughters is known. The breeders who are testing under this plan and who have herds of high quality will also find the recognition and publicity given their records by their breed association to be of commercial value in the sale of stock.

Breeders who wish further information about the herd test plan now being used by the Ayrshire, Holstein, Jersey and Guernsey breed organizations should write to their association or club to American Agriculturist, or to the New York State College of Agriculture at Ithaca.

—W. T. CRANDALL,
Cornell University

A Sanitary Milk House

What points should I consider in making my milkhouse as clean and sanitary as possible? I plan to build this spring.

THE approved milkhouse should be well lighted, well ventilated, floors and walls easily kept clean and located at some distance from the stable.

In the construction of a milk house, concrete is universally used for the foundation, the floor, and for at least 1 foot of wall above the floor line. Concrete is chosen because it is easily kept clean and is non-absorbent. Since light is an aid to cleanliness, the window area should be approximately 10 to 20

per cent of the floor space. Cross ventilation may be insured by the proper location of the windows. Ventilators in the gable ends of the milk houses are recommended.

"Construction above the foundation walls may be of wood, tile, concrete, or brick. Elevating the floor a foot or two above the ground level and extending is as a loading platform outside the building will make it possible to handle the milk conveniently."

Pasturing the Herd Sire

Is it against the laws of New York State to pasture a bull, which is over eight months old, in one's own pasture with his own cows, that is, if the bull is not very ugly?

WE are taking an excerpt from the Agriculture and Markets Law on the pasturing of live stock.

"It shall be unlawful for any person or persons owning or in the possession of any bull of the age of more than nine months, any stallion of the age of more than eighteen months, or buck or boar over five months of age, to suffer or permit such animal or animals to go, or range, or run at large on any lands or premises without the consent of the person entitled to the possession of such land or premises. (As amended by Chapter 38 of the Laws of 1925)."

It would seem that you can turn your herd sire out in your own pasture but, can you guarantee that he will not get into your neighbor's pasture? There are many advantages in a safe bull pen where he can do no harm.

Cooling Milk

Would you advise cooling over an aerator or is can cooling in a tank all right for the average farmer?

ACCORDING to tests at the State Experiment Station at Geneva, cooling in well-constructed farm tanks is easier and equally as efficient from a sanitary point of view as cooling over an aerator. The electric refrigerators now being offered for sale for use on dairy farms are practical and reliable. Whether the farmer uses a tank of the old style using ice or one of the new ice machines, the tank should be large enough so that when filled with cans of milk, there will be twice as much ice and water as milk. A tank 35" wide, 60" long, and 26" deep has a capacity of six cans. When the six cans are in, there are two gallons of water and ice for each gallon of milk.

What Will the Cows Eat Next Winter?

(Continued from Page 3)

will do well even during a dry summer."

Sorghum can be planted later than soybeans since it matures fairly rapidly and the Amber variety, when drilled in good land, free from weeds, will produce a very satisfactory hay crop. The hay should be cut when the seeds are in the early dough stage and cured in the ordinary manner. Something also to be considered, although perhaps not so important in New York State, is the possibility of the poisoning of cattle by pasturing the second growth. No cases of poisoning as far north as New York have ever been reported but in the south, pasturing the second growth of sorghum is out of the question.

Another crop more or less related to sorghum and requiring about the same soil and climatic conditions is Sudan grass. Sudan grass may be drilled or sown broadcast after the middle of June and the hay has about the same feeding value as timothy.

"Have you ever-trying millet," I asked.

"Yes, I have, I usually don't get

around to sow until after all the rest of the crops are out of the way. I have planted as late as the first week in July and still had very good results. I usually sow the Japanese millet although I understand that some of the neighbors have grown the foxtail millet and got somewhat larger yields but the hay was a good deal coarser. I have usually tried to grow millet on good soil although I have used the land next to the orchard in late years that has always been badly infested with quack grass as I find that millet chokes back the weeds very nicely. I sow about a half bushel to the acre broadcast and then forget about it until along the latter part of August", he added. "Immediately after blooming I cut the entire piece and cure it and pile it in the small stacks. I have never had any large amount and have fed from the stacks until it was gone as by that time, I have usually had cabbage roughage to use as supplemental feed."

Analysis has shown that millet hay has a feeding value of somewhere between the red clover and Timothy and since yields are usually fairly good, it will serve very satisfactorily as a supplement far into the winter. Millet should be fed very sparingly to horses as it acts as a laxative and diuretic but when fed once a day to cattle has never been known to cause serious results.

We walked back up towards the barn where Mr. Jeffrey's son was preparing to milk their 35-cow dairy with a milker and as we walked down between the rows of fine sleek cattle, I noticed that the cows were picking away at something that looked like alfalfa but yet was different.

"Why," I said, "You never told me about growing sweet clover for hay."

"I have been growing that for several years," said Mr. Jeffrey.

"Is it satisfactory?" I asked.

"Well, you know sweet clover is a biennial and one year I had a small piece that I thought I would use as pasture so I put in sweet clover early in the spring without a nurse crop, using inoculated seed and having the ground in fine shape. As it turned out, I did not use the piece for pasture and so I cut the clover for hay the first year. I cured it and the cows seemed to like it and after cutting the crop the next year early, got enough growth to turn under a fine leguminous sod."

"Probably more farmers would like to know about this," I said. "I never thought about sweet clover as being a particularly good hay crop but I see now where in certain cases, it might prove very useful."

"Well," he said, "I have grown it every year, but I find that we have to inoculate and apply a certain amount of lime each seeding."

Inoculation and lime are important in the growing of any legume, and should never be neglected, especially if one is trying to grow a legume as an emergency or catch hay crop to utilize land where the main crop has failed. I suppose the ideal farmer would manage so he would never be compelled to buy hay or have need for enlarging his forage crops. However, when the farmer is struck with a combination of situations such as the dairymen of the milk shed have during the past two years, it is absolutely necessary that he know what crops are available and best suited to his conditions to meet the emergency.

Clean Milk

Two things are important in producing clean milk. These are cleanliness and coldness. Cleanliness means a clean cow, clean utensils and a clean dairyman. This does not mean a great deal of extra expense or fancy equipment. The next greatest essential in clean milk is to cool it quickly enough. Milk should be brought to 50 deg. F. or lower within an hour after it is produced. The milk tank seems to be the most satisfactory and cheapest method of cooling milk on the average dairy farm. Clean milk can be produced with a milking machine as readily as by hand providing proper sanitary measures are observed.

Cold storage provided by special electric equipment

General Electric milk cooler

There are 200 practical uses of electricity and of General Electric equipment in farming. Consult your electric power company—find out which of these labor-savers will bring you the greatest immediate profit.

Increase Your Profits with Electric Refrigeration

"I CONSIDER the General Electric milk cooler as offering the most practical and efficient method for cooling milk on a dairy farm," writes a Massachusetts farmer.

Another dairyman says "The week before we installed our General Electric milk cooler we lost \$7.50 because a part of the milk did not rate Grade A."

More profit on milk is bound to come when you have a General Electric milk cooler. Milk carefully produced and then cooled in the G-E cooler is sure to make a low bacteria count—commanding the maximum price. Connect it to the electric outlet, and the General Electric milk cooler is ready to serve you. It is economical to operate, automatic, and trouble-free.

For farm purposes other than milk cooling or

use in the home, other makes of refrigerating machines have been equipped with G-E motors and control and afford many advantages and substantial profit. For instance, wherever perishable fruits and vegetables are raised, a "cold room" will permit them to be held for the highest market and the best profit. You may obtain refrigeration systems with G-E motors and control equipment that will provide automatic and care-free operation and will be your assurance of satisfactory electrical service. Investigate all the conveniences and profits from the use of electric refrigeration on your farm.

Send for our booklet "Sell the highest priced milk on your route," Address Room 313, Building 6, General Electric Company, Schenectady, New York.

Reviewing the Latest Eastern Markets

Milk Prices

April Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		
2A Fluid Cream	1.66	
2B Cond. Milk		
3 Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
4 Hard Cheese	1.50	1.30
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for April 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter a Shade Lower, Steady

CREAMERY SALTED	Apr. 3, 1931	Mar. 27, 1931	Apr. 4, 1930
Higher than extra	28 3/4-29 1/4	29 1/2-30	30 1/2-40
Extra (92 sc.)	28 1/4	28 3/4-29	30
84-91 score	26	25 1/2-28 1/2	32 1/2-38 1/2
Lower Grades	25	25 1/2	31

Shortly after we closed our report last week the butter market broke a half cent. On Monday, March 30, the market held steady and firm at the lower figure. Early in the day there was a slight flutter when the opening sale on the exchange was made at 27 3/4c for creamery extras. This brought out the buyers in full force and the price was quickly bid back to 28 1/4c. As the market closed nothing was offered below 28 1/2c. From then on throughout the week the market has moved along very satisfactorily and prices have fluctuated only to a very slight degree. The official daily quotations have not shown any change.

There are two or three outstanding features worthy of note this week, the principal one being that the New York market has been very short of intermediate and cheaper grades of fresh butter.

Another feature of the market has been the sharp differential between Chicago and New York prices. On April 1, New York and Chicago were on par for the first time in several weeks. If Chicago is able to hold steady for awhile it may mean an advance in New York City.

On March 27 the four cities reported storage holdings totaling 8,949,932 pounds of butter compared with holdings on the same day a year ago amounting to 12,111,228 lbs. From March 20 to March 27 the four cities reported an out of storage movement totaling 1,009,800 lbs. compared with an out of storage movement during the same period a year ago totaling 1,300,181 lbs.

Fresh Cheese Easy

STATE FLATS	Apr. 3, 1931	Mar. 27, 1931	Apr. 4, 1930
Fresh Fancy	15-16 1/2	15 1/2-16 1/2	18-18 1/2
Fresh Average			24-26
Held Fancy			
Held Average	21-22 1/2	21	22 1/2

The market on fresh cheese eased up this week when some lots were sold as low as 15c. Trade has been very quiet and the demand very limited for fresh goods. It was to be expected that prices would move lower when one could see the situation existing in the trade. Although, the market on cured cheese is not very active nevertheless it is holding fairly steady.

By March 26 the ten cities reported cold storage holdings totaling 10,765,000 pounds. On the same day a year ago holdings totaled 12,582,000 pounds. From March 19 to March 26 holdings increased in the ten cities to a total of 131,000 pounds, whereas during the same period last year holdings decreased 68,000 pounds.

Good Call For Cheap Eggs

NEARBY WHITE	Apr. 3, 1931	Mar. 27, 1931	Apr. 4, 1930
Hennery			
Selected Extras	25	25-26 1/2	32
Average Extras	23 1/2-24	23-24	30
Extra Firsts	23	22-22 1/2	28
Firsts	22	22 1/2	26 1/2-27 1/2
Undergrades		21 1/2	26
Pullets			
Pewees			
NEARBY BROWNS			
Hennery	25	24-26	30
Gathered	21 1/2-24	20-23	26

Cheap eggs have had the call all during the week ending April 4. Independent retailers have been actively seeking these bargain goods in order to

compete with the chain stores. Accordingly, the higher grades and more desirable eggs have not received all the attention due them. On March 31, some of the fancy Jerseys went as high as 27c but the market soon slipped away. The fact that the Pacific Coast producers announced a two cent drop on their product for next week had an immediate dampening effect on fancy nearby. Buyers were more conservative because of the prospective lower prices on Pacific Coast eggs and a great many sold rather than store. As the market comes to a close there appears to be a little more speculative interest but we see nothing to indicate any material improvement in prices in the near future.

On March 27 the ten cities making daily reports had on hand 892,000 cases of eggs whereas on the same day last year they held 880,000 cases. From March 20 to March 27 storage holdings in the ten cities increased 262,000 cases whereas during the same period last year holdings increased 302,000 cases.

Poultry Market in Good Shape

	April 3, 1931	Mar. 27, 1931	April 4, 1930
FOWLS			
Colored	30-41	24-26	30-33
Leghorn	35-37	22-23	26-27
CHICKENS			
Colored		22-30	24-34
Leghorn		21-23	25-42
BROILERS			
Colored		38-	30-37
Leghorn			-15
OLD ROOSTERS	13-14	12-13	
CAPONS	45	42-45	40-50
TURKEYS	30-40	30-45	30-42
DUCKS, Nearby	22-26	22-26	-22
GESE	15-16	15-	18-19

The poultry market winds up in very excellent shape. On Friday, April 3, buying was active at the terminals and the situation looked good. There did not appear to be any possibility of a burdensome oversupply of poultry for the holiday.

We omit the quotation on fowls above as up to the time this report was written no definite price has been established. Colored fowls were placed chiefly at 27c. But the market was left open to test the situation. The price represented a 2c advance over the early part of the week. Rock and Red broilers were selling in a runaway market. On Friday night colored broilers had reached 41c but if the situation continues and no heavy shipments arrive there is no telling where the market will be before it closes. The majority of the Reds and Rocks are being placed at the top quotations, Reds topping at 38c and Rocks at 41c.

There has been a serious accumulation this year of baby rabbits, both white and colored which are having no outlet and receivers have been at a loss in trying to dispose of them. Someone is going to be very disappointed when they get the returns on these baby rabbits which were undoubtedly sent to the market to be sold as live Easter bunnies. It is not wise to ship any merchandise of this type unless you are absolutely sure that the man who is handling the goods has a ready market in which to dispose of them.

Hay Market Improves After Poor Start

The hay market eased off during the early part of the week ending April 4 due to a half hearted demand and plentiful supplies. Buyers showed more life and receipts were lighter toward the weekend and prices strengthened materially. As the market comes to a close straight timothy brings from \$22 to \$27 per ton; clover mixtures \$20 to \$25; grass mixtures \$20 to \$25. Although grass mixtures are quoted the same as clover, they have not been as strong and in some cases concessions have been made.

Meats and Livestock

CATTLE—Load medium 1059 lb. steers about steady at 8.50. Cows steady, few good grades 5.50-5.75. Common to medium 4.00-5.25. Low cutters and cutters 2.50-3.50.

HOGS—Few medium grade 200 lb. weights steady at 7.75.

COUNTRY DRESSED CALVES—Receipts were liberal during the week. Slow to fair trading was up to and including Thursday. Friday's receipts

were moderate and buying slow. Prices were unchanged but irregular. Market closed weak and not cleaning up. Fresh receipts per pound: Choice 12-14c; fair to good 10-12c; small to medium 5-10c.

HOTHOUSE LAMBS—Receipts liberal to heavy during the week. Demand fair to good and higher on fancy Thursday and Friday. Market steady. Good to fancy, each, 8.00-10.00, a few higher; fair to good 4.00-7.00; imitations, each 2.00-4.00.

LIVE RABBITS—Receipts liberal to heavy during the week. Demand slow to fair at irregular prices. Market closed weak at 15-25c per pound.

MAPLE SYRUP—Market steady; United States Commercial Standard, graded and filtered per gallon: No. 1, 2.25-2.35; No. 2, 1.75-2.25; No. 3, 1.65-1.75 (Farmers run equivalent to No. 3). Sugar in casks, farmers run 20-25c.

WOOL—New York better fleece wool, unwashed, fine, per pound, 20-30c; 1/2 blood 20-26c; 3/4 blood, 20-23c; 1/4 blood 17-22c; low quarter blood 17-19c; common and braid, 17-19c.

Dandelion greens from New Jersey appeared last week on the Philadelphia market for the first time this season and opened at \$1.50 to \$1.75 a five-eighths-bushel basket. Some also were reported at New York, selling at \$2.00 a bushel. Prices soon fell away to 50c to \$1.25.

P. D. FULWOOD, TIFTON, GEORGIA

New York Farm News

N. Y. City Stops Sale of Apples by Unemployed

POLICE Commissioner Mulrooney of New York City has sent out an order that the selling of apples on the street corners by the unemployed in the midtown area of Manhattan be discontinued on April 15. Readers will remember that the sale of apples by the unemployed, an idea originated by Joseph Sicker, began around Election Day last Fall. Unquestionably, thousands and thousands of bushels of apples were sold to consumers who would not have bought except from the unemployed. To this extent, it has meant an additional outlet for the apple crop.

Unfortunately, from the standpoint of New York growers, the apples sold at first consisted entirely of western boxed apples. More recently, quite a number of men have been selling New York State McIntosh.

The order that this method of selling must stop April 15 applies to the midtown business and theatre sections.

Time for Master Farmer Nominations

SEVERAL weeks ago we mentioned that it is time to make your nominations for the 1931 class of New York State Master Farmers. To be considered, nominations must reach us before May 1. The majority of New York State counties now have at least one Master Farmer. If your county does not or if there are others that you feel deserve this honor, will you not send their names and addresses?

Remember, that to be a Master Farmer, a man must not only raise good crops and animals, but also be willing to work for his community and provide a good home for his family.

In making nominations, your name will be held confidential. Although you have until May 1, to send in nominations, why not sit down now while you think of it and send us the name and address of a man you believe should be honored in this way.

Several merchant associations have protested, claiming that it has degenerated into a "racket." Many of those who started to sell apples branched out, some hiring several men to sell for them, others offering other products for sale, mainly tangerines and chocolate bars.

It will still be possible, of course, for pushcart men, by obtaining a license, to sell apples and other fruit in the section mentioned. The city temporarily permitted these unemployed men to sell apples without first securing a license.

Road Investigation Rumored in Erie County

OUR Erie County correspondent writes that District Attorney Moore of Erie County, has asked for a \$25,000 appropriation which has been granted by the Board of Supervisors for an investigation into county road building operations. We understand that one contracting firm has already been indicted.

We are informed that this investigation came as a result of some concrete work on a road near Buffalo that went to pieces the first winter after it was put in.

State Grange Master Sets Goal

The following program for New York State Granges for 1931 was sent to us by State Grange Master Fred J. Freestone of Interlaken, New York. Certainly it sets a goal which every subordinate Grange in the state could well attempt to reach.

Organization and Membership

- (a) Ten new Granges in 1931.
- (b) Net Gain of at least five members in every Grange.
- (c) Personal work to avoid dropping

for non-payment of dues and in re-instating old members.

(d) Careful and complete survey of community for worthwhile candidates.

(e) Each subordinate Secretary report promptly at close of quarter to State Secretary.

(f) Increase Pomona membership.

(g) At least one new Juvenile Grange in each County.

(h) Not one lost or dormant Grange in 1931.

Fraternal and Ritualistic

(a) Strive for Honor Grange recognition; not less than one hundred additional Honor Granges this year.

(b) At least one Degree Team in every Grange; conferring degrees without the manual preferred.

(c) Stress the fact that our organization is a fraternity.

(d) Open and close ALWAYS in full form; without manual is more impressive.

(e) Present flag at altar, if possible, for Grange salute.

General Activities

(a) Singing Contest at State Fair.

(b) Revolving Scholarship Fund, every Grange contributing.

(c) Grange outstanding organization in community.

(d) Publicity—tell the Grange to the world.

(e) Deputies call conference of every officer in the county, Pomona and Subordinate, Plan County program.

(f) National Grange Monthly in every Grange family.

(g) Support Grange Insurance—Fire, Life, and Automobile.

(h) Support all moral activities in the community.

Legislature Rebuked

LAST week, Governor Roosevelt sent a special message to the Legislature rebuking both Democratic and Republican members for killing the measure that would do away with the collection of fees by Supervisors in the payment of state money to rural school districts. The Governor stated that the only service which the supervisor renders in the transaction is to deposit the money in his account and write a check for the same. For this, under the present law, he collects a fee of one percent of the money.

The Governor in commenting on the killing of the bill said that it was local political patronage which should be discontinued.

State to Raise Game Fish

AN arrangement whereby New York State will get an increased supply of light bass for lakes and rivers has been made by the New York State Conservation Commission in cooperation with the Bureau of Fisheries of the United States Department of Commerce.

The Superintendent of the Federal Hatchery at Cape Vincent on the St. Lawrence, has been instructed to take 500 male and female adult black bass from fishermen in Lake Ontario and place them in the bass breeding ponds newly constructed at the Cape Vincent Hatchery. The bass fry and fingerlings reared at the hatchery will be distributed entirely in New York State. The rearing ponds at Cape Vincent will be similar to those in the State hatchery at Ogdensburg.

Western New York News

ERIE COUNTY Pomona Grange was held at Hamburg March 28. Van C. Whittemore, Steward of New York State Grange gave the principal address of the evening lecture hour on "Adjusting Our Farm Practices to Meet the 1931 Farm Situation". Mr. Whittemore is a son of old Erie, having grown to manhood in the township of Collins where his forbears were among the early settlers.

Cattaraugus County is preparing to

Are Your Buildings Under the Shadow of Grime?

GOOD paint—Larkin Paint—is a farm investment that pays remarkable dividends. Well painted buildings denote a well run farm—and more, they protect the farm investment. Paint protects your expensive barns and silos, just as it does your house. If your farm buildings are under the shadow of grime, here are the Larkin Guaranteed Paint Products that will give you the greatest protection with the smallest investment.

Larkin Guaranteed House Paints IN 43 BEAUTIFUL COLORS

Larkin Barn and Roof Paint

IN RED AND SLATE GRAY

Larkin Porch or Deck Paint

IN FOUR DURABLE COLORS

Liquid Fiber Roof Coating

STOPS AND PREVENTS LEAKS

Larkin 4-Hour Dry Varnishes

AND ALL PURPOSE ENAMELS

LARKIN Paint Products are guaranteed to satisfy or new paint will be put on free. Apply Larkin Paint according to directions, and if for any cause you are not entirely satisfied, we will furnish new paint and pay the cost of putting it on your building. You take no chances when you deal with Larkin.

LARKIN Food STORES

DAIRYLEA

Dried Skim Milk

A Quality Product For Poultry, Calves, Pigs

DAIRYLEA Dried Skim Milk in poultry rations, insures growth and health. Strongly recommended by feeding authorities. The ideal food for growing chicks. Increases egg production and improves hatchability in layers and breeders. Also excellent for calves and pigs. Manufactured in plants of the Dairymen's League Cooperative Association, Inc. from the same high quality milk that is approved for New York City. Guaranteed by years of careful laboratory analysis and experiment.

Carried by local feed dealers and feed stores. If there is no representative in your town, order direct from New York office.

Packed in 100 lb. bags and 150 lb. Barrels

Fill out coupon and mail today A.A. Dairymen's League Cooperative Association, Inc. Room 2140, 11 West 42nd St., New York City Please send free bulletin and prices on Dairylea Dried Skim Milk.

Name _____ Address _____ My feed dealer is _____

Just "Paint" the Roosts

Paint the top of the roosts lightly with "Black Leaf 40". The heat from the birds' bodies releases the fumes, which kill lice.

No Handling of Birds Recommended by Experiment Stations and Colleges everywhere. To Kill Mites: Spray nests and inside of house with "Black Leaf 40" according to directions. If your dealer does not have it, send \$1.00 for 100 bird size. Tobacco By-Products & Chemical Corp., Incorporated, Louisville, Ky.

REDWING STOPS CANNIBALISM 3 oz. 75c, 7 oz. \$1.50. C. G. ROOKS, Sidney, N. Y.

Can the East Beat Missouri ?

By L. E. WEAVER
A. A. Poultry Editor

RECENTLY, I had a long talk with Professor Berley Winton who is one of the poultry extension men in Missouri. Ten years ago or more I worked with him in Kentucky; he was a County Agent then. For the past six or seven years he has been down where they have to be shown, and he has been showing them the results they have been getting in chick raising were interesting and I believe are worth a little study.

L. E. Weaver

Do you remember when we used to say that in estimating how many chicks we should get in the spring we should first figure how many pullets we wanted next fall and then start with three times that many chicks? We counted on losing one-third of them and having half of those that were left roosters. How far out of date those figures have become is shown by the results of the Missouri poultrymen.

Preventing Losses

In the first place, they could see no good reason for such a heavy loss every year. They thought it could be prevented to a certain extent, at least. So they worked out a set of rules for preventing losses in chick raising. Since it was largely a matter of keeping the chicks free from disease they called them "Healthy Chick Rules."

The first year only five people followed the rules and reported, they were trying them out. In the five flocks together 2250 chicks were started, and 1980 of them were raised. That figures out to 88 percent or almost 9 chicks raised out of every 10 that were started.

That was back in 1924. Every year since then more and more farms have followed the plan, and the percent reared has never been less than 83; once it was up to 89 percent. Last year was their biggest season. On 826 farms 427,677 chicks were started and 363,764 were raised, an average of 85 percent. Perhaps that is one reason that eggs are so cheap now.

Rules Are Simple

It certainly looks as though this Missouri plan is getting results. They are not up to 100 percent yet so there is a chance that our Eastern men may do even better. I know there are many who are actually beating those figures right along now. I am afraid that the

average is very much below that figure, however.

Here are the rules as Professor Winton gave them to me:

1. Start the chicks before May first.
2. Raise the chicks on clean fresh range.
3. Brood each hatch separately.
4. Feed a growing ration.
5. Separate the cockerels from the pullets.
6. Maintain sanitary, roomy quarters.

In looking over these rules one is impressed at once with their simplicity. There is nothing at all unusual or mysterious about them, just good old-fashioned common sense. In fact, what they say is briefly: "Start early, feed well, keep everything clean, and give plenty of room." And the emphasis is placed on keeping everything clean. That seems to be the one thing that we can't learn. With modern brooding equipment and with modern feed formulas and feeding methods, it is no longer any trick to raise chicks if we can keep disease and parasites away from them, and keep them away from the disease and parasites. New range and clean houses are the best insurance against the hazards that we know of.

Surely if Missouri can get such results with such simple rules the eastern poultrymen can do at least as well.

Marketing Duck Eggs

"We are interested in raising Indian Runner ducks for egg production but we know nothing about marketing them. Could you tell us where we could get in touch with a good buyer. We would like to be informed about the shipping of eggs—how many dozen eggs will a special duck egg crate hold, etc."

MOST duck growers raise ducks for meat and the egg production is only incidental. Therefore, the market for duck eggs is not so well developed as the hen egg market. Most any dealer in eggs will handle duck eggs and I would suggest that you write to the Department of Agriculture and Markets, 53 Park Place, N. Y. City for a list of bonded egg dealers.

Duck eggs are packed in the case in the same manner as hen eggs, that is, five fillers on each side of the case with a flat between each filler. Since they are larger a case will not hold as many eggs. There are ten fillers in a duck egg crate and each filler holds twenty-five eggs. Complete sets of fillers and flats can be obtained from the Indiana Board and Filler Company,

"I wish you'd put in an oil burner, Mrs. Brown, that coal man's a mess."—JUDGE.

Danger of Infection

Among Baby Chicks

Success in raising baby chicks is dependent upon proper care and management. Readers are warned to exercise every sanitary precaution and beware of contaminated drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbour germs and ordinary drinking water often becomes contaminated and may spread disease through your entire flock and cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose half your chicks. Take the "stitch in time that saves nine." Remember that in every hatch there is the danger of some infected chicks—danger of diarrhea in some form and other loose bowel and intestinal troubles. Don't let a few chicks infect your entire flock. Give Walko Tablets in all drinking water for the first two weeks and you won't lose one chick where you lost dozens before. These letters prove it:

Mrs. Bradshaw's Remarkable Success in Raising Baby Chicks

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. I used to lose a great many of the little downy fellows from bowel troubles, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 420, Waterloo, Iowa, for their Walko Tablets for use in the drinking water of baby chicks. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens are larger and healthier than ever before. I have found this Company thoroughly reliable and always get the remedy by return mail." —Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

Never Lost One After First Dose

Mrs. Ethel Rhoades, Shenandoah, Iowa, writes: "My first incubator chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko Tablets to be used in the drinking water for baby chicks. It's just the only thing to keep the chicks free from disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."

You Run No Risk

We will send Walko Tablets entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is when used in the drinking water for baby chicks. So you can prove—as thousands have proven—that it will reduce your losses and double, treble, even quadruple your profits. Send 50c for a package of Walko Tablets (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Pioneer National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

Walko Tablets are sold by leading druggists and poultry supply dealers.

FARM MECHANIC

Will Soon Be Whitewash Time

It will soon be time for spring house cleaning about the premises as well as in the home. Hog houses, outbuildings, poultry house walls and roosts, barn and stable interiors, and so on need recoating not only for appearance but as an efficient aid to better lighting and sanitation. Booklets giving a wide variety of well-tested recipes with full directions for both plain and disinfectant whitewashes can be obtained free from the National Lime Association, Washington, D. C.

Whitewash should be looked upon more as an aid to appearance than as any protection against weather or decay, although some do have some protective value. The appearance will be improved for one or two years, after which it will have to be gone over again. After a surface has had a number of coats of whitewash it is likely to start peeling, and then will have to be gone over with a stiff wire brush before good results can be obtained. For outside protection, whitewash cannot compare in effectiveness with good paint.—I. W. Dickerson.

The Cost of Pumping Water

"What does it cost to pump water by electricity?

THE total head involved determines the cost. Head may be part suction, part elevation (or corresponding pressure above the pump) and part pipe friction. However a quarter horsepower motor will pump 600 gallons per hour to a height of 35 feet or against a pressure of 15 lbs. Such a motor takes about a quarter of a kilowatt hour per hour and at an eight cent rate that would be two cents for pumping 600 gallons of water.

For a given consumption of water every 24 hours a small motor and pump would have to start oftener and run longer than would a large motor and pump. The small motor and pump would have a lower first cost and would pump at practically the same cost gallon for gallon as the large pump. The ideal size would be one that could keep up with the maximum demand of the day, which would therefore require only a small tank and which would be pumping a large part of the time except at night. A large unit would either require a large tank or it would pump for very short periods with long rests between and that is not something for which we want to spend our money.

Wiring Buildings

"How can I ask for a good job of wiring when I don't know anything about it?"

THE best way to do is to ask your power company for a sample specification and a contract form. Nearly every power company now has a specialist on this rural work who will be able to give you the desired information.

Postmortem for Poultry: Inquest Held at M. A. C.

Of interest to poultrymen who are having trouble with disease or other disorders in their flocks is the diagnostic service offered by the department of veterinary science at M. A. C. The department will examine specimens of poultry and determine the trouble affecting it under the following conditions.

Cool specimens thoroughly promptly after death, wrap in an airtight container and send prepaid, marked Perishable, directly to the Department of Veterinary Science, M. A. C., Amherst, Mass. Avoid shipment on Friday or Saturday as specimens may decay in the mail.

A specimen (shipment) consisting of not more than five chicks or two adult birds from one farm will be examined for two dollars. Make check or money order payable to the treasurer of the college and send it with the letter of history of the specimens at the same time the shipment is made.

How to Break Up a Setting Hen

If you will try this you will have a laugh on the hen and still break her up.

In the nest place an alarm clock and set it to ring in a half hour and cover it with hay and wait until it rings. The hen will become interested in the ticking of the clock and will listen patiently to it, but when it goes off the hen will jump from the nest and will not enter it again until she gets ready to lay again.

The Target Is Being Raised

I WAS reading a report from Harry I. Nickerson about his 38 Rhode Island Red pullets. He said that he got 42 dozen and five eggs during the month of January, 1931. I can beat that. I have 38 Plymouth Rock pullets that were 9 months old on January 15, 1931. During the month of January, 1931, I received 47 dozen and 6 eggs. Who can beat that?—Edward Fuller, Potsdam, New York.

On page 14 of the March 14th issue of the American Agriculturist for 1931 under the heading "A Challenge Answered" Harry I. Nickerson of Dolgeville, N. Y. he states that he has 38 Rhode Island Red pullets, and in the month of January 1931 he got 42 dozen and 5 eggs.

According to averages that is a total of 509 eggs averaging 13½ eggs a day for a 31 day month or a percentage of 35½ % flock production.

I have 34 Rhode Island pullets hatched May 10th and for February 1931 laid 52 dozen and 1 egg or a total of 625 eggs averaging 22 1/3 eggs a day for a 28 day month or a percentage of 65 2/3 flock production. I have kept a daily egg record of these birds from the date of their hatching and these records can be inspected at any time. Now from all that I have read regarding challenges please throw my hat in the ring and consider me a contender by printing the record of my birds. I also have approximately 500 White Leghorn pullets and these birds for flock production are averaging between 55% and 60%. I have kept accurate records regarding feed and can tell by

Seeing Is Sometimes Hard Believing

(Continued from Page 9)

amused by a laughable debate that took place in the Senate while we were there on the TB indemnity bill. It was a special bill to pay a farmer for a cow that had burned up in a barn after she was condemned but before she was appraised. One Senator compared her to Mrs. O'Leary's cow who kicked over a lantern and burned up the city of Chicago.

Lieutenant Governor Herbert Lehman, President of the Senate, and Senator John Knight, Majority Leader, welcomed our party to the Senate and made a little address to them.

We then visited the Assembly Chamber which was also in session, and were received by Assemblyman Frank Smith, Chairman of the Committee on Agriculture in the Assembly.

Governor Roosevelt at Home

Leaving the State Capitol, the Master Farmer party who by that time were beginning to drag their heels, walked to the beautiful new State Office Building, the highest and finest building in Albany. Here we were received by Commissioner Henry Morgenthau, Jr., head of the State Conservation Department and publisher of American Agriculturist, and by Commissioner Berne A. Pyrke, head of the State Department of Agriculture and Markets. After brief addresses by these gentlemen, Assistant Commissioner C. P. Norgord introduced the various bureau chiefs of the Department of Agriculture and Markets who explained briefly but in a very interesting way the many and varied responsibilities of their positions. One Master Farmer remarked afterwards that he had never before realized the great amount of work which the State Department of Agriculture and Markets carries on for the farmers of the State.

The large party then was shoved into elevators and dropped like plummets to the lobby of the office building from which we traveled across the road to the great Educational Building. Here we were received by Commissioner Frank P. Graves and by the various department heads. We were ushered into the Regents room where Commissioner Graves explained briefly some of the work of the Department. He said, "This is where the Regents meet. Many people believe that Regents examinations are made here, but as a matter of fact, of course, the Regents papers are made by various educators scattered throughout the State."

By this time it was nearly five o'clock when we were expected at the Executive Mansion by Governor and Mrs. Roosevelt, so again shepherding our flock together we hustled them into cars and went to the Executive Mansion, that historic home of New York's Governors. A pleasant hour was spent here visiting with one another and with the genial Governor of the Empire State and his Lady. By that time everybody was willing to call it a day.

Your winter bouquet can be planned now. Plant seeds of straw flowers of various colors and shapes, follow the directions given on the packets for cultivating them, and after they blossom cut the flowers from the plant before wide open. Then hang head downward to dry, and your winter bouquet will follow without difficulty.

* * *

The lupine produces long spikes of pea-shaped flowers. These are obtainable in about six shades of color.

KERR'S NEW LOW PRICES

PLACE your order now for Kerr's Lively Chicks. These prices are attractive for chicks that have a rich laying inheritance from birds that have made big records in leading egg-laying contests.

Cook Roasts Slowly

Vegetables the Best Spring Tonic

WHEN a housewife cooks a rib roast of beef or a leg of lamb she must consider how much loss there is likely to be from shrinkage. Naturally she wants the meat to "go as far" as possible. Dietitians in schools, hospitals, and other institutions have the same problem on a larger scale; they must be able to estimate both the number of servings and also the nutritive value of each serving. Shrinkage of meat during cooking means a dollars' and cents' loss to the manager of a restaurant, cafeteria or hotel dining room, or to a delicatessen where cooked meat is sold. The shrinkage affects the appearance, palatability, nutritive value, and the quantity of meat available for serving.

In the last four years the Bureau of

Home Economics of the United States Department of Agriculture has been accumulating meat-shrinkage data in connection with the nation-wide co-operative study of the factors that influence the palatability of meat. There seems to be a close relation between shrinkage and oven temperature; that is, when meat is roasted from start to finish in a very hot oven the shrinkage is greater than when the meat is first seared at a high temperature rapidly reduced. For example, if, after beef ribs have been seared in a hot oven, the temperature is rapidly reduced so as to finish the cooking very slowly, the shrinkage of the meat when rare is only about one-eighth of the fresh weight; whereas if the roasting goes on to the end in a hot oven the shrink-

age is about one-fourth of the fresh weight.

Well-done beef shrinks more than rare beef, other things being equal. Well-finished, high-grade beef and lamb roasts lose more fat and less water during cooking than very thin meat of the same kind and cut.

Avoid Tonics

IT will not be necessary to resort to iron tonics in the spring if large quantities of vegetables which provide iron are eaten all during the winter. Neither is it necessary to spend a lot of money for such vegetables, since spinach and lettuce are usually priced reasonably in the larger markets. These are rich in iron and vitamins and should be served often. Three times a week is the rule for leafy vegetables.

Two vegetables a day in addition to potatoes should be served. These vegetables may be selected from carrots, beets, cabbage, onions, turnips, squash, lettuce and spinach. The methods of serving vegetables should be varied so that they are attractive and do not become monotonous. This in itself will avoid much of the trouble which moth-

Upsets old ideas OF oil stove speed

No. R-609 New Range in pastel green, ivory and black. Five High-Power Burners.

NEW INVENTION

HIGH-POWER
BURNER

30% faster...

easy to light...economical of fuel

Greatest oil stove improvement in 25 years! High-Power speed, as fast as a standard city gas burner! Here's heat to boil the kettle in a hurry. Heat to make a sizzling hot frying pan in less than 2 minutes!

All the heat you can ever need for quick roasting, yet easily controlled for custards and angel cake.

Over 30% faster, with a saving on

fuel! High-Power cooking uses less kerosene per meal.

New Perfections in color from \$18 up Every Perfection has a new dress of modern color. Soft pastel green, dainty ivory and lustrous satin black. Smooth porcelain, lacquer and baked enamel finishes. Sturdy steel construction.

See the new Perfections at your dealer's. Choose the one you like best, and start this week to enjoy its speed and convenience. No pipes or wires, no chimney connection—just place it where it saves most steps.

BEFORE YOU BUY ANY STOVE Consider the cost of fuel. Kerosene is the cheap, dependable fuel. High-Power Perfection stoves give you the cooking speed of the more costly fuels using the economical fuel... safe, clean kerosene.

NOW! MODERN ICELESS REFRIGERATION EVERYWHERE!

Superfex Oil Burning Refrigerator. Light the burners only once a day. Keeps food fresh and pure... right in your kitchen.

Also made for use with gas. Send for free booklet.

Some distributors' territories still open. Write for franchise details.

PERFECTION STOVE COMPANY • Cleveland, Ohio

PERFECTION Oil Burning STOVES

The fish net sweater blouse is one of the smart, new ideas of the season and is very easy to crochet. The illustration shows the body of the sweater in white with trimming rows of black, scarlet and green. Shetland floss may be had at 25 cents per ball, 4 balls of white, 2 balls each of black, scarlet and green being required for the 16 year size. Other colors may be had upon request but unless otherwise specified, the colors used in the illustration will be sent. Crochet hook of right size for this floss is 10 cents. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

Instruction sheet is sent with the order.

ers have in getting children—and their fathers—to eat the proper amount of vegetables.

On the farm where vegetables have been canned fresh from the garden, it is easy to supplement the above list with excellent vegetables from the can. There is somewhat of a protest against canned vegetables, but those which have been canned while in prime condition are to be preferred to those which have been shipped from long distances and arrive in the market in a condition which would not be accepted by the best canneries.

One of our readers in anxious to get a recipe for Montgomery Pie. She has been told that it is familiar to the housewives in Berks, Bucks and Lancaster Counties, Pa. If you have one which you have tried and know to be good, send it in to the Household Editor, American Agriculturist, 461 Fourth Ave., New York City.

Plan to have a rotation of bloom by planting a batch of gladioli corms every ten days from early spring until the end of June.

Aunt Janet's Corner

How Readers Manage for Time to Sew

THE letter from "A Reader of the Home Page" in a recent issue of American Agriculturist brought scores of letters from friendly readers of the Corner who wished her to benefit from their experience. Every single letter which came in had one or more excellent suggestions and, best of all, they were couched in such friendly terms that it seems as if all understood the "Reader's problem and wished to help her solve it.

It will not be possible to print all the letters which came to American Agriculturist, but we are giving here a few of those written by people who have found several ways of shortening work in order to leave time to do family sewing.

—Aunt Janet.

First Prize Letter

MOST of us women with families have the same problem as the "Reader of the Home Page." Before my marriage 17 years ago I was a high school teacher. My husband is a farmer on a 200-acre farm, so I know full well what work is. During those years, the family has varied between 9 and 4, not counting wood cutters, ensilage cutters, threshers and transient

workers. In that length of time I've found certain ideas helpful.

The Reader is fortunate in being able to get machines. If she hasn't these, she should get them as a starter; mop wringer, kitchen stool, brushes of various kinds, especially floor, dust mops, and window washer, large baking sheet, large dripping pan, adequate supply of stainless steel sharp knives, sufficient pans and basins, pressure cooker.

Why do those shut-up rooms have to be swept and dusted? If the rooms

For the Smart Matron

3018

DRESS PATTERN NO. 3018 is one of the smartest designs of the new season in simple good taste for day wear. Its lines are designed for a slimming effect. The neck line is very becoming with flat applied band trim and softly falling jabot frill. The wrapped skirt adds height to the figure. Plaided sheer woolen in dark blue tones trimmed with a plain shade, jersey tweed, or flat crepe silk would be suitable for this design. The pattern cuts in sizes 36, 38, 40, 42, 44 and 46-inches bust. Size 36 requires 3 3/4 yards of 39-inch material with 3/8 yard of 39-inch contrasting. PRICE 15c.

Lingerie Ensemble

3028

LINGERIE PATTERN NO. 3028 has been designed for both the slender and the full figures. A youthful detail is the flaring legs of the side closing panties. The centre-front shirred bandeau closes at the center back. It requires 1 1/2 yards of 39-inch material with 5/8 yards of the binding for the 16 year size. The pattern may also be had in sizes 14, 16, 18, 20 years, and 36, 38 and 40 inches bust. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. Add 12c for one of the spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

lived in are kept decently clean, those closed rooms should be left alone till it is time to use them again.

Does the Reader think she must iron all of the underwear, nightgowns, sheets and kitchen towels? Such things should be hung out carefully when wet, dried thoroughly, then put away without an iron touching them.

Do the children wait on themselves and pick up their own playthings? They should have plenty of simple things to play with—dolls, blocks, toys, crayons, etc. and then should be left alone as much as possible to play with them. When it is time for meals, naps, outdoors, or other things, they should pick up their own things. If there is no good place to put them, a

WHAT A KITCHEN KNIFE CAN TELL YOU ABOUT WASHDAY

A kitchen knife and easier washdays! They may seem miles apart. And yet...

Unwrap a bar of Fels-Naptha and cut into it. As the blade eases through the big generous bar, what do you see? ... from top to bottom a smooth, velvety texture that plainly says, "This is unusually good soap!" But don't stop here, for the best is yet to come.

Hold this soap up to your nose and sniff. Naptha! You can smell it. Naptha, the grease-dissolver! Plenty of it all through the bar.

So every time you use Fels-Naptha you get the help of two safe, active cleaners instead of one. Plentiful naptha working hand-in-hand with good golden soap. Briskly, busily, this sturdy pair loosens the most stubborn dirt and washes it away without hard rubbing. And that's why millions of women say Fels-Naptha is the real washday bargain. It brings you not merely "more bars," but more help. Extra help that saves you!

Next washday, try Fels-Naptha.

Try it any way you choose. In tub or machine; in hot, lukewarm or cool water; for soaking or boiling. See how much quicker and easier it makes your washing; how sweetly clean and fresh it gets your clothes. Notice, too, how gentle Fels-Naptha is to the hands. That's because it loosens dirt so quickly that you don't have to keep them in the water long. And every golden bar contains bland, soothing glycerine.

Your grocer sells Fels-Naptha. Get a few bars today. Or, better still, ask for the convenient 10-bar carton—then you'll have extra help aplenty for all your washing and cleaning tasks.

SPECIAL OFFER—We'll be glad to send every user of laundry soap a Fels-Naptha Chipper and a sample bar. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use it and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naptha!) just as you need them. Send only four cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Dept. 1-4-11, Fels & Company, Philadelphia, Pa. © 1931 FELS & CO.

Under Frozen Stars—By George Marsh

high laced boots! A costume for women unknown in Kiwedini.

"W'at —w'at you do, Meester Jeem?" she feebly gasped, overwhelmed with embarrassment.

"She's been in the lake, Marthe," explained Stuart. "She upset and drifted across from LeBlond's. Needs hot soup and a fire—quick! I'll rustle dry clothes for you, Miss—Miss—"

With a flash of white teeth the girl laughed: "Oh, didn't you guess? I'm Aurore LeBlond!"

Jim Stuart was startled. The blood showed in his tanned cheeks as he replied: "No, I didn't know." Then he said: "Marthe will take care of you, Miss LeBlond. Get those wet clothes off and dry out. My cook will have some supper for you shortly."

LeBlond's daughter, at Sunset House! Impossible to get her back across that lake until the wind died! What a situation! What would LeBlond, his rival and enemy do? He'd saved the life of LeBlond's girl. It was a huge joke on the free-trader. Now what would he do?

As the girl followed the Ojibwa woman into the log house, she turned in the doorway and called to Stuart: "Merci, monsieur, oh very many thanks for saving me from a watery grave!" With a laugh she disappeared.

The Next Problem

"Well, Omar, sne's surely a cool one! Half frozen in those clammy clothes, she stops to make fun of our breaking our backs to reach her before she let go that canoe. Gratitude, eh—and nerve?"

"Ah-hah!" grunted the half-breed, "Louis LeBlon", he ees lak dat. He don't care for nobodee. How you get her home?"

"Get her back—against this wind? She'll have to stay till it drops."

With a grunt Omar stopped in his tracks, his face black with disapproval. "You know w'at dat mean?"

"I know. He'll make a fuss, no doubt, but there's no help for it. She can sleep in my quarters with old Sarah. I'll stay with you."

"We tak' her back by de shore, now, w'en she dry out and eat," insisted Omar.

"Now? Alongshore—in a canoe? If we didn't smash the boat on the rocks, it would take us most of the night," objected Stuart.

"Ah-hah! But eet weel be bettair. We breeng her back to LeBlon' een de morn' an' we have troubl'. You don't know dat feller."

"No, I don't suppose I do, Omar. But I know that he's putting us out of business, and that will mean all our work here is lost. No, I don't know LeBlond, but he'll know me before I quit."

CHAPTER II

THE SQUAT SARAH, the Scotch-Ojibwa who presided over Jim Stuart's kitchen, was in a ferment of irritation, as she bustled about her stove. The daughter of the hated free-trader, LeBlond, whose influence with the Indians and ability as a fur man was threatening the very existence of Sunset House and the future of "Meester Jeem" Stuart, was shortly to test her cooking. She had seen the canoe land and watched Stuart, followed by Omar, lead what she imagined a half-drowned boy to the cabin. Then, to her astonishment and wrath, Stuart had appeared to announce that this girl in men's clothes—this shameless daughter of his rival across the lake, was to be fed.

With her fire well started and the kettles on, the outraged Sarah had lost no time in shuffling over to the rear entrance of Omar's cabin for a whispered council of war with the equally

indignant Marthe. Yes, it was true what Sarah had seen. Short hair and men's breeches! No Ojibwa woman would bring shame to her sex by shearing her hair, and as for the "gibodiegwason"—the breeches? Marthe's rolling eyes and hunched shoulders eloquently portrayed her thoughts. But then, some white women are mad!

Yes, Marthe informed Sarah, her swart face sobered with the gravity of the news, this girl of LeBlond's was now calmy seated by the stove in a calico slip and the underwear Stuart had brought her from the trade-house, waiting for her clothes to dry. She was going to put them on again—wear them, to eat with Stuart. Sit at his table in those breeches of a man! She would put a spell upon him—the shameless one!

With much wagging of dark, braided heads the women parted.

The Daughter of an Enemy

Jim Stuart's knock at the door of Omar's cabin brought the reply: "Coming!"

Shortly the door opened and the daughter of the man who was rapidly driving him out of the fur trade at Mitawangagama—Ojibwa for The Lake of the Sand Beaches—stood in dry woolen blouse caught at the neck by a scarf of crimson silk, and whiplashes; on her stockinged feet a pair of the begrudging Marthe's beaded moccasins.

"You're warm again—no chill?" he asked, poignantly aware of the picture she made in the frame of the door.

"Yes, my heroic rescuer," she began archly, "and now, Monsieur Sourface, that I'm warm and dry again and look less like a drowned fish, do you not like me better?"

The fluttering of her black hair in the wind; the allure of her thick-lashed eyes; the clean lines of her build held the appraising sweep of Stuart's gaze, as she posed, hands on hips, free of all self-consciousness, watching him in frank amusement.

"But you do not answer me!" she said impatiently.

"No, Miss LeBlond," he replied in mock gravity, "I think I prefer you as a 'drowned fish.' You were then more respectful to your 'heroic rescuer.'"

"But my hair was plastered with water and my eyes red!" she objected, vehemently. "See it now—how it waves when it's dry!" and she ran her fingers through the crow-black plumes of her wind-tossed locks.

"Yes, it's very—nice!" he replied, aghast at her amazing candor, as he walked beside her toward his quarters.

So this was the new girl, the younger generation!

"Very nice?" she countered with a toss of the head. "In Winnipeg, they call it beautiful!"

Trouble Ahead

"I'm sure they do," he said absently, his eyes measuring sky and wind-whipped lake; his face suddenly grave with the thought of Omar's warning: "We breeng her back to Louis LeBlond een de morn' an' we have troubl'."

But how could they paddle her back to-night against that wind, he asked himself. Then he heard the girl at his side say:

"You are not polite to your guest, Mr. Stuart. I have said twice that, since you have shaved, you are quite good-looking."

Stuart's lean face reddened. What would she say next? He had not been "outside," down to the railroad and civilization, since his discharge from the army on his return from France. But in the stray papers and magazines which had reached him in the hinterlands of Kiwedini, he had read of the manners and dress of the younger generation. The frankness of this "specimen," however, was startling.

"I'm sorry," he said. "Now you haven't told me how you happened to paddle that canoe from your shore past the lee of the islands. You see what a risk you took?"

"Sorry you're good-looking?" she teased. "What a modesty! . . . Oh, I was tired of listening to that fool, Paul Paradis," she explained, "and it wasn't rough inside the islands. But, outside, before I knew it, the wind caught me and I couldn't turn back. You know the rest."

"You had a close shave, Miss LeBlond," he said quietly, wondering at her seeming lack of gratitude for the battle two men had made with wind and sea for her life.

She turned impulsively, placing a hand on his arm, as her face sobered.

"You don't have to tell me that," she said, and the raillery left her brilliant eyes. "I died out there, today. I knew I couldn't last—hang on, much longer. . . . Then I saw you coming!"

He looked suspiciously at her dark face. Was she acting? But the straight gaze which met his betokened sincerity.

"I thought you didn't know," he said, lamely.

"Didn't know?" she cried, almost savagely. "You think me a fool?" Then, swiftly, her mood changed. "Ah, I will now make amends to my heroic deliverer from the raging waters of Mita—Mitawangagama—is that right?"

—The Lake of the Sand Beaches!" she laughed. "Sir, you have rescued a water-logged maid from the fishes! She will never forget your bravery—or your surprise at her whiplashes! She thanks you with all the heart she has—left!" Aurore LeBlond bowed grotesquely, until her hair touched the long grass of the clearing.

He watched her in silence, with a quizzical smile, puzzled, wondering, half-charmed, partly repelled. "Let's see what Sarah has got for us," he suggested. "I'm hungry, aren't you?"

"Starved! She won't poison me, will she? Marthe's eyes snapped fire when she saw me in these." The girl lifted a shapely leg and curled her toes in the smoke-tanned moccasin, far too generous in size for her foot.

"You did startle them—in those," he laughed. "You rather startled me; I haven't been in Winnipeg since the war."

Introducing Smoke

"You poor man!"

"No, I've lived in Winnipeg—and prefer this. Hello, Smoke!" Bursting from the spruce at the edge of the clearing where he had been hunting rabbits, Smoke loped up to the man and girl approaching the dog stockade built of spruce slabs, surrounding Jim's quarters and his vegetable garden.

"What a handsome dog!" she cried. "Why, he's much larger than any of father's! Where did you get him?"

"He's a Hudson's Straits Ungava," said Jim, proudly, rubbing the erect ears of the massive head. "He's always glad to see me. Aren't you, old scout?"

The hairy throat of Smoke rumbled a reply as he reared and placed his great fore-paws on Jim's chest.

"He's a raving beauty! Why did you name him Smoke?"

"When he was a small pup, he was almost entirely black, except his nose and feet."

"The darling! Will he let me touch him? Most of father's won't."

"Smoke, this is a friend of mine," said Jim, rolling the great black-and-white head from side to side. Dropping the husky to his fore-feet, he commanded: "Shake hands with her!"

With a red grin which bared his formidable tusks, the Ungava raised a hairy paw which the girl took.

"Smoke," she said, with a laugh, as the dog's slant eyes watched his master's face, "You're not polite; you don't look at the lady when you shake hands."

"Like his master, he's embarrassed by beautiful ladies," said Jim, as they left the dog at the gate of the stockade and entered the house.

"Is that why you prefer this life to Winnipeg—because of your shyness of the ladies? But you'll be lonely when this beautiful lady goes."

Here indeed was no false modesty. "What makes you think so?" he teased.

"Oh, everyone is. But you're hardly polite. How nice and comfortable you are here!" she went on, her eyes moving from the chairs built of spruce and birch in the round, the caribou and bear-skin rugs, to walls bare except for moose-horn gun-rack and two shelves of books.

He reddened under his tan. "You're laughing at my humble quarters. They're not much like your father's place, are they?"

Ignoring his remark, she faced him with: "Why do you men hate each other? Can't you trade with the Indians without fighting?"

Stuart laughed at her frankness. "We haven't exactly got to fighting yet; but I admit he's making it pretty rough for me."

(To be Continued next Week)

Western New York News

(Continued from Page 13)

send a carload of foodstuffs and clothing to drought sufferers in the South. Officers of its Farm and Home Bureaus assisted by the Master of Pomona Grange are in charge of the work. The car will be loaded at Salamanca, April 4.

To its many projects for the improvement of crop lands the Farm Bureau of Genesee County is adding one for the improvement of lawns and flower gardens. With the cooperation of the Home Bureau a contest is on under the name of Home Grounds project. Genesee is setting an example that neighboring counties might do well to follow.

From Olean comes the report that trappers of that section recently found a mother bear and four little cubs enjoying their all-winter snooze in a large hollow stump and although there was no shelter over it, apparently nothing had interfered with their slumber. Game protectors have warned that they are not to be disturbed.

The transfer of the Boston Valley Telephone Co., which serves a rural area in Erie County with a population of about 1000, to the New York Tele-

phone Co. was authorized March 25 by the Public Service Commission.

Niagara County Board of Commerce Fruit Committee has voted to adopt the appellation "Niagara Fruit Council" as a permanent title. Plans for the Apple Blossom Festival are already taking shape.

March is leaving a record of much cold and snow and little sunshine but wild geese are flying northward, robins have been seen and April is, at the door. Unless April proves a better month for sugaring than March has been, the sweet crop will not be large. Syrup is selling locally at \$2.25 per gallon.

Farm Products Prices Up One Point

THE U. S. Department of Agriculture reports a one point increase in the general price level of farm products from February 15 to March 15. On March 15, prices on farm products were 91 per cent of the prewar level while a year ago, they were 126 per cent of prewar level.

During the month, increases were reported on eggs, chickens, butter, lambs, horses, sheep, and hogs, while lower prices were reported on grains, hay, potatoes, apples, veal, calves, and wool.

New York County Notes

Columbia County—Spring weather half of last week and snow, rain, sleet and strong winds the other half. Farmers are busy repairing damaged roofs caused by a windstorm two weeks ago. Others are getting their next year's wood supply cut in the farm wood lot and sawed up into stove lengths in the farm yard. A car of western horses arrived in Hudson and many farmers have purchased. Two carloads of second-hand horses arrived there also from New York City. Many of them are all right for farm work, where they can be worked on soft earth, without wearing shoes for a time, as the only trouble with many of these city horses is their foot soreness from city pavements.

Town roads are soft and muddy as usual this time of the year. There seems to be a farm auction each week with prices good for first class stock and equipment.—Mrs. C.V.H.

Clinton County—The snow is mostly gone in the fields and the frost out of the ground. The roads are still lined with snow banks and will be for some time. The ice on Lake Champlain is still solid. Clinton County had the heaviest snow the past winter in many years. The men in charge of the roads did wonderful work in keeping them open. Those who live in the cities have no idea what those who live on the lonely roads were up against.—R.J.M.

Oswego County—March has been a fine month, came in like a lamb and going out colder.

The snow went in a few days. No frost in the ground. Has been a fair season for maple products but not as good as a year ago as it did not freeze enough nights. Syrup selling for \$2.00 a gallon. Had our first heavy rain on the 28th. Streets and wells filled up.

Farmers are hoping for a better year. A number of cars of things have been sent to the drought area. Baled hay—\$20.00 a ton; loose, \$10 to \$18. Milk is lower. Eggs 25 to 30c a dozen.—J. A. M.

Franklin County—At this date (March 27) sugaring is going on. It is late this year and indications in most sections are that there will be a short season. There is very little frost in the woods.

The Malone Fish and Game Club starts a drive for new members soon. Many farmers belong and more will probably join.

Reforestation on quite a large scale is starting this spring. Many private individuals as well as corporations are ordering young trees. High school boys in Brushton have formed the first 4-H Forestry Club in the county, each of its eighteen members ordering a thousand trees, making a total of 18,000 trees to be set by them on lots

selected from waste land on their home farms. Other 4-H members in various towns have ordered trees. Many will no doubt compete for the free trip with the State Reforestation Tour in September.

Thaws have been so gradual that we have heard of no high water damage. The Salmon, which carries off much of the melting water from mountain banks and streams, has not risen; is in fact at summer level in places. Farmers whose wells have been dry and who have drawn water and driven stock long distances to drink, all winter, are glad to have that necessity removed. The ground is rapidly soaking up surplus moisture.

Malone Light and Power Co. plans to plant 1,000,000 young trees on their lands this Spring. This will employ many for a while.—Mrs. W. R.

Steuben County—Some of the snow has gone and the fields are very muddy with some snow; a heavy rain arrived here on Saturday. There are many good gas wells in this county and nearby counties. Potatoes are now 75 cents. Most of the good lumber has been cut. Merle Tadder expects to saw near here soon. An R. D. mail carrier examination will be held April 11 at Bath.—D. C. F.

Genesee County—A two day's rain has settled the ground which is so warm that a mist rises from it when the sun shines. The winter was so mild and ground froze so little that the sap yield is small. Roads are fine for this time of year.

The farmers of Genesee County sent two carloads of farm products and foodstuffs to those suffering from the effects of the drought.

Everyone is busy getting ready for Spring's work with an optimistic outlook on the fact that even though prices may remain low, the yield may be larger.—Mrs. R.E.G.

Wyoming County—Through the efforts of Farm Bureau committeemen of Wyoming County, a refrigerator car of farm produce was donated to the drought area of Kermit, West Virginia. Despite the bad roads and the short period of time during which the collecting was to be done, a great deal of produce poured into Gainesville, where in ten days, the car was loaded. The assortment consisted of potatoes, cabbage, beans, turnips, apples, onions, carrots, maple syrup, honey flour, canned goods, wheat barley and oats, and was donated principally by farm bureau and home bureau members. The Onawa 4-H club of Strykersville gave the largest collection of canned goods. Altogether it is very gratifying to note the generosity and cooperation of these farm organizations in helping the less fortunate despite the impassable roads.—A. S.

SAVE YOURSELF

Aunt Janet's Corner

(Continued from Page 19)

large box from the grocer's answers nicely for storing.

If the Reader is not a Home Bureau member she should join the most convenient local unit and attend the meetings. She will learn many short cuts and efficient methods besides enjoying herself.

She should have a definite time each midday for a rest. Usually it is best when the children have their naps. This rest should not be omitted any more than getting the meals or other necessary work.

Plan ahead for a regular day of sewing. In the Reader's case, it would be either Wednesday or Friday. The day before, clean a double mess of potatoes, prepare enough roast to have left over, prepare the vegetables and fruit or plan to use from a can. Make the dessert ahead. Plan a midday meal that requires little dish washing. Then with a whole day ahead (maybe) go at the cutting of garments. Cut all the pieces for each garment and roll it up by itself. If there is some special detail to remember, write it down and pin the written slip to the material. Try to have an hour or two at a stretch for stitching. When all is organized, short parts of work can be worked in other days along with mending and other hand work.

To summarize these ideas, they are: use adequate tools; omit unnecessary cleaning; omit unnecessary ironing; supply children with playthings; have children wait on themselves; join the Home Bureau; have a daily rest period; plan ahead for a day's sewing.

A Well-wisher.

Second Prize Letter

An aunt of mine once said, "Be a law unto yourself when the dinner dishes are done that your housework will stop. Leave the afternoon free for sewing, mending or recreation. Housework is never done, so be its boss or it will boss you."

Have the morning work—breakfast, dishes, separator, daily sweeping and dusting—done by nine o'clock. From nine until noon, wash, iron, bake, churn or clean. At ten-thirty prepare and start the vegetables cooking, make a dessert. Have both dinner and allotted task finished by twelve.

I suggest you wash Monday, churn and bake bread Tuesday, Wednesday iron and clean upstairs, Thursday

churn, Friday do up big batch of cooking, Saturday clean rooms lived in and churn. With mid-week churnings small cleaning jobs may be worked in, like scouring sink or cleaning the lamps.

Make a list of daily duties, and find a way to speed up each one. I use a dish drainer, make simple desserts, iron only clothing and fancy pieces. I insist on the children's helping themselves and each other. They pick up their own toys and do many little things for me. I weed out unnecessary things and cut time leaks, such as gossiping over the 'phone. Sunday is for rest, with a simple dinner and no extra work of any kind.

My circumstances somewhat resemble yours. Married seven years, have a girl six, boy three and a baby. Power washer and pressure iron for conveniences, also tea cart. While my house is not always perfectly kept, I do accomplish a great deal and carry on a moneymaking occupation besides home work.

Try my ways, Lady!

—M. McC. F.

Prevent Runs

THERE is a right way to put on hose. The leg of the stocking should be rolled down, the foot slipped in, and the stocking rolled up over the heel to prevent unnecessary strain on the delicate threads. It should not be pulled up too quickly or too tightly. The holes which lead to runs may be caused by rings, shoe buckles, roughnesses on furniture, or carelessness in fastening the hose supporter. The supporter should not be made too tight, as this causes too great a strain when the knee is bent. It should not be fastened too low down in the stockings, but in the reinforced portion intended for this purpose.

Proper washing is another important factor in stocking care. A mild soap and lukewarm water should be used, with as little rubbing as possible. Strong soap, hot water, and rough treatment roughen the weave and may often lead to holes and runs.

The child enjoys his meals more if they are served at a small table and he is provided with a comfortable chair high enough to allow his elbows to rest on the table and low enough for his feet to rest firmly and easily on the floor.

HANDY ANDY Says "Here's How"

To Keep the Nose Fly Off Your Sheep

By Ray Inman

In a 6 inch plank bore holes 5 inches deep. Lay the plank up until June 1st. then move it to the sheep lot.

Put 2 inches of salt in the holes and coat the plank thickly on top and sides, with PINE TAR.

In getting the salt the sheep will tar their own noses, — and the bot fly will not bother a nose covered with PINE TAR.

"WHAT IS A NOSE FLY, ANYWAY?"

WELL, JUST FROM THINKIN' ABOUT IT A COUPLE O' MINUTES, WE'D SAY A NOSE FLY MUST LOOK SOMETHING LIKE THIS:

OF COURSE, NOT ALL NOSE FLIES WEAR SNOW SHOES, SOME WEAR CHECKERED VESTS INSTEAD. AND THOSE WHO WORK ONLY ON ELEPHANTS WEAR RUNNING PANTS, BECAUSE THEY HAVE TO DO SO MUCH RUNNING ABOUT TO COVER THEIR TERRITORY.

WHAT THE SAM HILL, WALTER? DID YOU THINK THIS WAS HALLOWEEN, OR ARE YOU LEARNIN' TO BE A DETECTIF?

NOPE. THIS IS MY NOSE FLY DECOY. WHEN ANOSE FLY COMES ALONG LOOKIN' FER ANOSE, HE CANT HELP LIGHTIN' ON THIS ONE. AND WHEN HE FINDS IT AINT A REAL NOSE HE'S SO HEARTBROKEN HE GOES OFF IN A CORNER AND CRIES HIMSELF TO DEATH.

A GREAT BOON TO SHEEP

HEY! LEGGO BY DOZE!

OW! YOU LEGGO BIDE!

EMBARRASSING PREDICAMENT OF A COUPLE O' NAUGHTY LITTLE SHEEP WHO THOUGHT THEY'D SNEAK A KISS WHILE NOBODY WAS LOOKING — BUT FORGOT THEIR NOSES WERE COVERED WITH PINE TAR.

Weather Advertising Clock Service

LAST fall we published a little item about the Weather Advertising Clock Service of Erie, Pennsylvania. At that time a subscriber wrote us that he had made a deposit with them and was unable to get delivery of the clock. They finally located R. Q. Rodgers, who, we understand, was handling the business. We referred this to the National Better Business Bureau and they reported that Mr. Rodgers had promised to fill this order. However, a later letter from our subscriber said that it never had been filled.

Just now we get another letter from central New York saying that a man representing himself to be Mr. R. Q. Rodgers, manager of the Weather Advertising Clock Service, came to his town and sold business places each a share in an electric clock and weather advertising unit at \$20.00 per share, said unit to be placed in front of one of the stores and to be delivered in 30 days. As yet these business houses have not received their clock and all mail sent to Mr. Rodgers at the address he gave has been returned uncalled for.

We are publishing this story for the information of our subscribers. The fact that mail sent to the address given by Mr. Rodgers has been returned unclaimed would not add to the confidence with which this scheme might be regarded.

* * *

Since writing the above account, we have received a bulletin on this concern put out by the National Better Business Bureau, in which they report numerous complaints from business men who state that they have received absolutely nothing for the money they gave to Mr. Rodgers. We also have a letter from the National Better Business Bureau to the effect that they have been advised that R. Q. Rodgers is now being held in Erie, Pennsylvania, and that persons who are interested in the case might well get in touch with William F. Detzel, Chief of Police, Erie, Pa.

Will They Make Good?

I am a subscriber of your paper and would like to inquire as to your knowledge of the financial responsibility and integrity of the Seneca Salt Company of Tiffin, Ohio. They are makers of a medicated salt for cattle feeding and guarantee a substantial increase in the milk check or money refunded, and also guarantee to pay all veterinary bills if cattle become sick or diseased while feeding this salt.

THE guarantee as explained by our subscriber, seems to cover the same ground as the one put out by the Continental Salt Company of the same address. Naturally, we wonder whether there is any connection between these two companies?

We have always wondered how a

company could possibly live up to such a sweeping guarantee. We suggest that our subscriber ask this company for a list of consumers in his own locality or county and see whether or not they have been satisfied with the dealings they have had with the company.

A Reader's Experience

I AM writing you to warn your subscribers against so-called Sales companies who advertise to sell your business or property at a fine price, advertising all over United States (so they say) and ask a premium in advance to defray advertising, etc.

It's only a scheme to get your money and that's the last one hears from them. A well established real estate company is the only one to trust. They do not require an advance deposit.

—A SUBSCRIBER.

Ellison Piano House Bankrupt

IN 1928 we published several stories in our Service Bureau columns concerning the activities of the Ellison Piano Company of Syracuse, Buffalo, and Albany. Recently we received a letter from a subscriber indicating that they are still in business. We started an investigation and have learned that Lawrence Ellison was never brought to trial because of the congested condition

Accidents Mean Expense

I RECEIVED my insurance policy check and was very thankful for it, for I had a lot of expense with my accident. \$280.00 just to fix the car, so you see \$40.00 helped.

I think the insurance is a great thing for a little money and I thank you again for your great service.

Yours truly,

A. M. Meyer.

Hamburg, N. Y.

Mr. Meyer was injured Jan. 23rd when his automobile skidded and he sustained fractured ribs.

of the court and various excuses which he put forward. He has, however, been under a \$5000.00 bail. In 1930 he went into bankruptcy and the trustees in bankruptcy are putting forth every effort to collect outstanding bills.

The letter referred to from our subscriber indicates that they are bring-

ing considerable pressure to bear on him in an attempt to collect on a piano he purchased from the Ellison Piano House. We, of course, are unable to say whether they will be successful in their effort to collect.

The indictments secured against Mr. Ellison about three years ago charged him with using the mail to defraud and with devising a scheme to obtain money under false pretences. The scheme roughly involves the giving of credit checks, each credit check being good only as part payment for a piano. It was charged by those responsible

Will Always Take A.A.

I WISH to let you know the...

Co. have sent me a money order for the \$3.98, so they have settled with me for the paintings. I thank you very much as I must say if it had not been for you I would have been cheated out of both my money and the pictures.

I am very pleased to think there is such a great thing as the American Agriculturist. We take the paper and always expect to. I thank you many times for your wonderful help and good work you have done for me and the great help your paper is to everyone that reads it.

for the indictment that the price of the piano was raised to cover these credit checks, and therefore they had no value.

As a general proposition, the A. A. Service Bureau advises against credit checks and would suggest that our subscribers place no value on them. It seems probable that they are used mainly to convince people that they are getting something for nothing.

Road Contractor Fails to Settle for Damages

It seems to me that there should be some way for the State to see that road contractors pay their help. I know of two families who were practically destitute this Fall because road contractors claim that the State did not pay them their money and, therefore, they could not pay their help. I, myself, have a bill for \$66.96 against a contractor for gasoline sold to his truckmen working on a job near here. The job is finished. I have written to him several times about the bill but get no reply.

WE have had an unusual number of letters from subscribers stating either that they were unable to get pay for materials furnished road contractors, or that they were unable to get settlement for damages which contractors did to their property or for land used in widening or building roads.

Of course, the State Highway Department cannot make the final payment to a contractor until the road is inspected and accepted. For that matter, claims which subscribers send in, have not all been against contractors who are working on state highways. In some cases, the highways were being built by County Highway Departments.

The State Highway Department seems to take the attitude that the matter is entirely between a property owner and the contractor. Doubtless, they are justified in that position yet it seems evident that our subscribers look to the State Highway Department as responsible for the construction of the road and have a distinct feeling that they should do something to require contractors to deal fairly and squarely with property owners.

For some time past we have received quite a number of letters from subscribers concerning dealings they have had with representatives of the National Board of Trade, a New York City collection agency.

If other readers have had dealings with this concern we would be more than glad to have them drop us a line telling us about their dealings with them.

ADD NEW SOURCES of INCOME to your farm

Put idle land to work for you night and day with profitable timber. Other crops are overproduced more each year, but a future shortage of trees is predicted. Plan, then, for a good income after a few years (and make your land more salable NOW).

Sell Lumber, Pulpwood, Posts, Poles, Firewood, Christmas Trees.

For high yield, low loss, choose hardy, vigorous Northern Grown Evergreens. Send for our profit study and planting guide booklet, "Evergreen Trees."

We furnish stock to state and commercial nurseries in increasing amounts. Our prices and stock must be right.

Put Idle Acres to Work!

American Agriculturist

Write the

Service Bureau of

461 Fourth Ave., New York City

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912.

Of American Agriculturist published weekly at 10 N. Cherry St., Poughkeepsie, N. Y., for April 1, 1931, State of New York, County of Dutchess, ss.

Before me, a notary public in and for the State and county aforesaid, personally appeared Henry Morgenthau, Jr., who, having been duly sworn according to law, deposes and says that he is the Publisher of American Agriculturist, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in section 411, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are: Publisher, Henry Morgenthau, Jr., Hopewell Junction, N. Y.; Editor, Edward R. Eastman, 139 Caryl Avenue, Yonkers, N. Y.; Managing Editor, Edward R. Eastman, 139 Caryl Avenue, Yonkers, N. Y.; Business Manager, Henry Morgenthau, Jr., Hopewell Junction, N. Y.

2. That the owner is: (If owned by a corporation, its name and address must be stated and also immediately thereunder the names and addresses of stockholders owning or holding one per cent or more of total amount of stock. If not owned by a corporation, the names and addresses of the individual owners must be given. If owned by a firm, company, or other unincorporated concern, its name and address, as well as those of each individual member, must be given.) American Agriculturist, Inc., 461, 4th Ave., New York, N. Y.; Henry Morgenthau, Jr., Hopewell Junction, N. Y.; Edward R. Eastman, 139 Caryl Avenue, Yonkers, N. Y.; Elinor F. Morgenthau, Hopewell Junction, N. Y.; E. C. Weatherby, 306 Elm St., Ithaca, N. Y.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent, or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear on the books of the company, but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is (This information is required from daily publications only.)

Henry Morgenthau, Jr.,
Publisher.

Sworn to and subscribed before me this 27th day of March, 1931.

Family Gets Check from Farm Machinery Policy

Claim No. R-53579	New York	Check No.
North American Accident Insurance Company		
Home Office, 209 So. La Salle Street		Not Valid unless Release on Back is Signed by Claimant
Chicago		
January 13, 1931		
Pay to the order of Maude Wigham, Administratrix of the Estate of Howard L. Wigham, deceased,		
Two Thousand and No/100 ----- Dollars		
PAYABLE THROUGH		
THE NORTHERN TRUST CO.		
CHICAGO, ILL. 2-15		
		Claim Examiner.

ABOVE is a reproduction of a check sent to Maude Wigham, administratrix for the estate of Howard Wigham of Franklin, Delaware County. Mr. Wigham had a farm machinery policy which he secured from an A.A. subscription salesman.

Mr. Wigham was struck in the arm by fragments of a bursting fly-wheel on a buzz saw. He was not discovered for some time and lost a large amount of blood. His arm was amputated and later a transfusion was made in an effort to save his life.

The accident occurred December 18, and the check to Mrs. Wigham was dated January 13.

RICH IN SUNSHINE VITAMIN D

The Growth Food for Growing Birds. Rich in Nourishment. Complete in Vitamins. Nothing Extra to Buy or Mix

Three things about Pratts interest every poultryman with new pullets to grow. First of all, it is complete in Vitamins. Second, rich in every food element that growing birds need. Third, its ingredients are always perfectly uniform and, therefore, promote growth that is perfectly uniform.

That's a lot to say about one growing mash. Complete in Vitamins! What a story by itself. Thanks to our colleges, we now know that vitamins *must* be present in feed before the nourishment in that feed can make growth.

So Pratts have processed or added every Vitamin to their growing mash. Sun-Vitamin D in abundance because it enables birds to absorb the kind of nourishment that promotes big strong frames, full healthy bone, generous coat of feathers.

Growth Vitamins A and B be-

cause they enable birds to get the things from their feed that build size, weight, strength, health, vigor, ability to lay. And we all know

that these Pratt ingredients are chock full of nourishment: Oat meal; dried buttermilk; corn meal; wheat middlings; meat scrap; fish meal; alfalfa meal; and the major minerals, too.

Rich in nourishment—Complete in vitamins—And uniform! Every good poultryman likes to see uniform flocks. They will only grow that way if feed is uniform. And Pratts

guarantee not only the quality, but the uniformity of every bag of Growing Mash, regardless of how the market price of ingredients may vary. Yet Pratts does not cost one cent more than any other good feed.

Put your birds on Pratts now. See your local dealer. We will send you his name, gladly.

THE POULTRYMAN'S VITAMIN GUIDE FREE

The supply of these is almost exhausted. Poultrymen everywhere want them to get the facts on the vitamin story. Send for your copy free and postpaid while they last. Pratt Food Co., 124 Walnut St., Dept. 000, Philadelphia, Pa.

New York Has A New Trespass Law

Posting Made More Effective Against Irresponsible Persons

NEW YORK State has a new trespass law or rather an important amendment to the old Conservation Law in relation to trespassing on private lands. This law just passed by the State Legislature and signed by Governor Roosevelt increases the protection which farmers may have by posting their lands.

Under the old law, posting only protected against hunters and fishermen. The new law will keep out everybody if you so desire. The posting law now provides that signs not less than eleven inches square shall be posted warning all persons against trespassing thereon, which notices shall be posted not less than forty rods apart, close to and along the entire boundary of the property. Posting of such notices shall be sufficient, provided that illegible or destroyed signs be replaced once a year during the months of March, July, August, or September."

The suggested word "posted" set forth in conspicuous lettering on such notice shall be sufficient, but in our opinion it is much better to be specific with the wording on the sign. The following is a good example:

NOTICE!

No Trespassing

PRIVATE LANDS: all persons are warned against Hunting, Fishing, Berry-picking, Fruit-picking, etc., hereon, or Trespassing hereon for these purposes, or for any other unlawful purpose, under penalty of the Law. Posted in accordance with the provisions of Sections 361 and 362 of the Conservation Law and Sections 1290-1299 and 1937 of the Penal Law by

Name
Address

All trespass signs must now be signed with the name and address. If your signs are already posted without your signature, you had better see that they are signed.

A person who violates any provision of this law shall be guilty of a misdemeanor, and in addition thereto is liable to a penalty of from \$10 to \$50, together with the costs of the suit, in addition to the actual damages, all of which may be recovered in the same action. It shall be the duty of the State police

and game protectors and all peace officers to enforce the provisions of this law and to prosecute all violations thereof.

AMERICAN AGRICULTURIST was instrumental in securing the passage of this bill, because of the thousands of letters we receive from farmers complaining about trespassers. More than half of these complaints have not been against hunters or fishermen at all, much of the trouble being caused by thousands of irresponsible people who have wandered at will across farmer's crops, camped on his property without permission, leaving debris behind, broken down his fences, and in many cases actually stolen his products. AMERICAN AGRICULTURIST has maintained that it was unfair to decent sportsmen who hunt or fish to post land against them,

while at the same time permitting under the law, other people who often cause the most damage, to enter upon the land without hindrance.

It is interesting to know that it is not necessary to post to get protection under the trespass law against certain individuals or groups. For example, maybe you do not want to post everybody off from your farm, but there are certain persons whom you know who may have caused you trouble before and whom you want to keep off. All

that is necessary is to hand them a written notice containing a description of the premises and warning them against trespassing thereon. Maybe on another day you will find a group who are on your land causing damage or disturbance. Under the law you can go to them and hand them a written notice, as suggested above, and if they do not leave im-

mediately, they may be arrested and fined.

In general, however, the new posting law still does not help the man who does not post his land, and we are not urging farmers to post unless they absolutely have to. Many have little or no reason for posting. As a matter of fact, any farmer should not put up posting signs, if he can possibly get along without doing so. It is probably better to give the public a chance, as long as that public appreciates its privileges and acts accordingly. After all one of the finest assets in the world in the great outdoors. In order to maintain health and happiness it is necessary for city folk to get out into the sunshine and air as much as possible. Most farmers have no objection to decent people who come upon their lands and conduct themselves in an orderly manner without doing damage to property. It is only when the farmers cannot protect their rights in any other way that they should resort

(Continued on Page 16)

A true sportsman of this type will respect farmers' property rights and should be welcome as a guest. It is the irresponsible sportsmen and other trespassers that require strict trespass laws.

Powered with Socony Special + Ethyl

this plow equals ten horse plows

THIS four-disc tractor plow takes the place of ten horse plows. And Socony Special Gasoline *plus* Ethyl gives it the power to turn six times as much dirt in one trip around the field as a one-horse plow.

Be economical this year: use Socony Special *plus* Ethyl to power your tractors for spring plowing. You'll cover more ground in less time and do it better.

Farmers in New York and New England who have large acreage recognize that Socony Special *plus* Ethyl and the New Socony Motor Oil service their tractors more efficiently, more economically than other fuels and lubricants.

Farmers more and more are using Socony products on their farms.

This four-disc plow, powered with Socony Special *plus* Ethyl, does the work of ten horses and does it without straining the muscles and sinew of the "plower."

Socony Lubricote (Household) Oil, made for farm and household purposes where a light oil is required. It is useful for lubricating lawn mowers, guns, and all kinds of light machinery.

Socony Kerosene is a high-quality burning fuel. It is made especially for lamps, oil stoves and farm lanterns.

Socony Disinfectant is a concentrated coal-tar product with more than twice the strength of pure carbolic acid. It quickly kills

disease-producing germs and disagreeable odors. It is especially useful in keeping stables germ-free and healthy.

In addition, we make many more products for use on the farm.

How many of them are you using? Socony Turex Oil (for Diesel and Oil Engines) . . . Leather Dressing . . . Mica Axle Grease . . . Parowax . . . the New Socony Motor Oil . . . Socony Banner Gasoline . . . Socony Herd Oil (Cattle Spray) . . . Socony Tree Spraying Oils.

SOCONY

PETROLEUM PRODUCTS FOR THE FARM

STANDARD OIL COMPANY OF NEW YORK

New York State Needs Regional Markets

How the Sale of Nearby Farm Products Would Be Helped

EDITOR'S NOTE—There is much interest right now in regional food markets in upstate cities. Commissioner Pyrke tells why in the article on this page which was originally broadcast by him over Radio Station WGY.

ONE noon time in January last, a busy office manager entered a down-town restaurant in New York, and gave his luncheon order in a crisp businesslike tone, as follows:

"A lettuce and tomato sandwich, strawberry shortcake and a glass of milk." The waiter accepted the order without even a tilt of the eyebrows and the other patrons of the eating place showed no interest. It was treated as a commonplace transaction, and so it was in nineteen hun-

By **BERNE A. PYRKE**
New York State Commissioner of Agriculture
and Markets

dred and thirty-one, but forty years ago it would have aroused consternation, because no part of the order would have been understandable in mid-winter, except the glass of milk. A person attempting to give such an order would have been set down for a third rate joker or a likely candidate for a mental observation pavilion.

The filling of such an order at the present time is the result of a revolution, a chilly revolution, not a revolution in Chile, though such things are not unknown in the South American continent, but a revolution in transportation by the application of the art of refrigeration to the carriage of perishables. Until relatively a few years ago food could be transported only for the distance in which spoilage at the temperature of the season would not ensue, now with the aid of artificial refrigeration it is transported from the ends of the earth, frequently crossing the equatorial belt on its destination to northern ports.

This revolution was and is fine for the consumers of our great cities, but at the same time has greatly intensified the competition of the farmers of New York and neighboring states.

Western New York lettuce that will meet heavy competition from other parts of the country.

Icing cars of perishable Western products on the way to the largest market in the world—New York City. —Photo By Ewing Galloway.

When I was a lad the most baffling statement which I heard was that the "sun never sets on the British Empire." Upon observing the regularity of the habits of the sun which served our locality, I had for a long time difficulty in understanding the apparent curious behavior of the sun of the British Empire. The understanding of advancing years later on cleared away the mystery, but the challenge of the statement remains with me. For present purposes, it might be paraphrased by saying that the sun is always shining on the gardens from which New York City derives its monumental supplies of fruits and vegetables and it is always harvest time in at least some corner of those fertile and far-flung gardens.

Getting back to the business manager's luncheon, it is to be observed that until comparatively recently lettuce, tomatoes and strawberries were in season but a few months of the year and were simply pleasant memories in the long winter period. Let us concen-

(Continued on Page 15)

Making Milk and Money With Alfalfa

How to Grow This Popular Legume Under Average Conditions

THE average farmer hears so many recommendations from so many different sources that quite frequently he is at a loss as to just what he should do. An agent will say "you must grow alfalfa." Some neighbor will say, "nobody ever grew alfalfa in this town." Someone else tells the farmer that only soil containing lots of lime can be used for alfalfa cultivation.

The collecting and boiling down of all the facts to meet the particular situation is an individual job. Perhaps the best way for the farmer to secure an idea of how to go about it is to talk with some one, preferably in his own locality who has had experience in the growing of this crop.

Calling on a neighbor of ours up in Cortland County, I was struck by his splendid crops of clover and alfalfa. I knew that the region was not too heavily supplied with lime, that the surrounding country had numerous wet spots and that it was not considered an ideal alfalfa section.

"How do you manage to get such a nice crop in this section?" I asked.

"It is quite a long story," he began, "I have made no attempt to grow alfalfa on all of my farm as yet, and probably never will. There are some sections of it to which alfalfa is certainly not adapted. You see the first requirement of alfalfa is a well drained soil. I have managed to secure this by continuous plugging year after year, tile drain-

ing where I could and using open ditches on the very worst spots. Of course, it would be best to tile drain the whole farm but under present conditions, I can not see that I am justified in doing so."

"How much lime do you use?" I inquired becoming interested.

"When I first started growing alfalfa, I had all of the soil on my farm tested by the county agent. I had always been able to secure a moderately good growth of Red Clover without much lime, but I had heard so much about the soil test that I resolved to have it done. The agent came around with a soil auger and took samples of both the top and the sub-soil. He explained to me at the time just how it was tested, and the main point was, that the lime content here was not sufficient for the growing of alfalfa although ample for Red Clover. He did tell me, too, that probably one ton of lime to the acre would meet my needs: also, if I needed more than a ton, that I should apply it the year before alfalfa on the

cultivated crop." He continued, "I always grow potatoes or corn the year before seeding as this keeps down the weeds that would choke the alfalfa."

"How about fertilizer?" was my next question.

"I always use a little fertilizer on all my crops and I usually sow around three or four hundred pounds of superphosphate per acre when seeding. When an alfalfa meadow has been down about three years, I use a little superphosphate especially on the poor places, although I try to get over all of the piece. I usually apply lime in the fall or as early as possible in the Spring of the year before seeding."

"What kind of seed do you use?"

"Well," said Mr. Jones, as we walked down across the end of the field where the odor of fresh cut alfalfa filled the air, "I imagine any reliable seed company would be all right. The most important thing is to see that the seed is hardy and suited to the conditions here. Northern grown seed is almost a necessity. I usually sow

a mixture of Grimm with Ontario Variegated, although some of my neighbors have tried common. The results from common seem to vary, usually giving a wonderful crop one year and winter-killing entirely the next. I find that my alfalfa stands the winter and yields as well as any in this section."

"How long do you leave a field down?"

"Right here is a field (Continued on Page 11)

Not every dairy farm in the East can grow alfalfa, but where it can be produced without too great cost, it certainly pays. It is generally recognized as the best roughage for dairy cows.

Vol. 127 April 18, 1931 No. 16

Thought for the Week

ARE we our brother's keeper? Farmers of New York State, led by county agricultural agents in several counties, have answered that question emphatically in the affirmative by collecting and shipping sixty carloads of farm produce collected from thirty-two farm counties for destitute farmers in the drought regions. No finer example of the splendid generosity of farm people has come to our attention in many years.

Nominations for Master Farmers

NOMINATIONS for Master Farmers, Class of 1931, will soon be closed. If you have a friend, neighbor or relative who, you are sure, meets with the very high requirements of the board of judges, send in his nomination to AMERICAN AGRICULTURIST, at 461 Fourth Avenue, New York City.

Remember that this man not only must be a very successful farmer, but more than this he must be an outstanding citizen, beloved by his friends and neighbors, and he must have created for his family a high type of American farm home.

Back to a Simpler Way of Living

WITHIN the memory of living men, even on our own Eastern farms, farm people produced a large part of what they consumed. There was always home-grown pork, a very frequent killing of beef, a fine garden, and a cellar stored full of both vegetables and fruit. What a lot of pride Mother always took in those great shelves of canned fruit and how good was that home-made bread that Mother used to bake, to say nothing of her pies and cakes, cookies and doughnuts.

But today in this age of specialization, we have swung to the other extreme, until farmers are just about as much consumers as people who live in the cities. And in this change, it seems to us, farm people have lost something of value. After all, what we are all trying to do is to live right and get something of happiness out of life. If farming has anything to offer it is in those satisfactions which are not measured in dollars, and one of these was the large use which our fathers made of home-grown products. Nothing that one can buy equals them in quality or taste or fresh-

ness. Standardized, machine-prepared food products are not in the class with most of those that Mother prepared.

We have a reason in bringing this matter up at this time. There may have been some excuse in recent years for ceasing to grow and to prepare stuff for the farmer's own table. Many argued that with the high prices paid for farm products and labor it did not pay to grow gardens. Help was scarce both on the farm and in the house, and it is a job to pick fruit or vegetables and can them. It simplified matters a lot to buy them from the local grocer. Then there was the butcher's cart coming by the house nearly every day. How much easier it was to buy the meat than it was to grow it and kill it.

There may have been something to this argument during the last ten or fifteen years, but we believe the situation is changing and that it is going to remain changed. We will never return of course, entirely to old time conditions but neither are we going back, at least not in many years, to the high prices that have recently prevailed. Prices are going to be stabilized on a permanently lower level—more as they were in the time of our fathers. Labor already is plentiful and while they are not down much yet, wages are certainly going to be much lower. Money on this lower price level will be harder to get, although it will go farther. We still believe that farmers will continue to specialize, but in recent years they have gone to the extreme; now there will be a tendency back to some at least of the simpler old time customs. In actual practice, this will mean that a lot of farmers will find that it does pay to grow good gardens, to kill beef cows occasionally, and to plant more small fruits for home use. Some even may separate their milk at home and have more home made dairy products. Inside the house the womenfolk will turn again at least a little way toward the customs of their mothers in supplying the table with more home-grown and prepared food with less dependence upon the grocery, delicatessen, and meat market. If our prediction comes true, then we believe also that more comfort and happiness will result than farmers get from the present tendency to factoryize farming.

Impossible to Free All Roads of Snow

MANY sections of the East have had a real old-fashioned winter, with the heaviest snow in years. This meant constant difficulty and irritation in many country communities in trying to keep the roads, particularly the dirt roads, open. Farmers on these roads are insisting, and we believe they are right, that from the standpoint of taxpayers and citizens they have just as much right to expect that the authorities keep their roads open as those do who live on the hard roads, and yet to be fair, the town authorities were faced with practically an impossible task this year in keeping the dirt roads free of snow. They had neither the facilities nor the money with which to do the job.

One town in New York State started out with the determination to keep the main dirt roads clear of snow. A heavy snow plow was purchased to be used in cleaning the main roads in each section of the town, but because of the insistent demands of the people, the work was extended to other traveled roads, until nearly \$4,000 for snow removal alone was spent. This additional bill added to the other road taxes has put the town on the verge of bankruptcy. This town has proven that on the basis of the present income for town roads, it is impossible in a bad year to keep all of the roads free of snow.

Just about the same situation exists in many towns in keeping the dirt roads properly worked throughout the year—that is, it is practically impossible to give every one road service without causing a ruinous tax.

Last year New York State passed a law greatly increasing the aid to dirt roads in most of the towns of the State, but it is plain that even with this additional aid much more must be done by

the State to give the farmers who live on the main traveled dirt roads anywhere near the kind of road service that those enjoy who live on the hard roads. This whole dirt road question is certainly a perplexing and irritating problem to both officials and farmers.

No Milk Investigation

ANOTHER milk investigation by a New York legislative committee has been suggested. We understand that the resolution will not pass. We hope not. There is plenty of reason for studying the situation in the milk market where the consumer pays so much and the producer gets so little, but political investigations get the milk industry nowhere. On the contrary, they excite the consumer by making him believe that he is paying too much for milk so that he cuts down his consumption, and at the same time, such investigations never result in better prices for farmers.

Sportsmen and the Farmer

WE call the attention of our New York State readers to the new and better trespass legislation which is explained in the feature article on the first page of this issue. It has been evident for some time that farmers must have better protection against trespassers, particularly from the vandalism type, who come each year in increasing numbers from nearby cities. We cannot help but be a little proud of the fact that AMERICAN AGRICULTURIST was instrumental in securing the passage of this important trespass bill increasing the farmers' protection.

Another bill of great interest to both sportsmen and farmers has just been passed by the New York State Legislature and signed by the Governor, fixing the last six days in October as the open season for pheasant shooting, instead of four scattered open days in October and November, as at present. The bill also provides that the open dates for shooting other game, including deer, bear, squirrels, rabbits, and partridge, are made to correspond.

There were several principles underlying this change in the open season. It was thought that a scattered open season favored illegal shooting and also tended to disturb and harass game not open to shooting at the time. It was also the thought that the nuisance of having so many sportsmen roaming across the farmers' lands will be confined under this new law to one period instead of scattered several times during the fall, as under the old system.

Eastman's Chestnut

MANY years ago when safety razors first came around, I volunteered to shave one of my friends with the new safety which I had just purchased and of which I was very proud. He was very patient, but the razor did not come up to my expectations and when I got through with him, he looked like a battlefield, and I never got a chance at him again.

I am sure my friend would sympathize with the man who was getting shaved by a barber, and after submitting in agony for several minutes, he yelled to the barber to get him a glass of water.

"What's the matter, what's the matter?" said the barber. "Got a hair in your throat?"

"No," shouted the man, "I just wanted to see if my neck would still hold water!"

* * * * *

I think it was my friend Clifford Gregory, Editor of *Prairie Farmer*, of Illinois, who told this little story:

Rusty (after a narrow squeak at railway crossing): "Whaffo' yo' blow yo' hawn goin' ovah dat track, 'Big Boy?' 'At ain' gwine do yo no good."

Dusty: "'At wan't my hawn. 'At wuz Gabriel's."

With Our A.A. Boys and Girls

THE New York State Conservation Department under Commissioner Henry Morgenthau, Jr., will start a new co-operative project in pheasant rearing this spring with boys and girls who are members of the 4-H Clubs. The plan is to enlist the co-operation and interest of the farm boys and girls in the protection and increase of wild life.

With the assistance of Club Agents and County Agents, a selected list will be compiled of 500 or 1,000 boys and girls best suited for the test rearing

half that number, will mean a very material increase in the pheasant stock.

The enterprise promises to be quite profitable to the boys and girls who undertake it, aside from the pleasure which they will undoubtedly get out of it. They will have no cost, except their own labor in caring for the eggs and birds, and the small amount of feed consumed in their rearing. They will be paid for the healthy birds soon after they have been delivered to the Game Protectors for liberation. This means ready cash, a fair profit on the project

state outlining the proposed plan and there has been a general, and in nearly all cases, an enthusiastic response from members of these clubs. Approval of the plan has been practically unanimous on the part of club officers and members. Several of the clubs are planning to offer special prizes to the 4-H Club member or members in their district who are most successful in the work.

HERBERT E. GASTON,
Secretary, Conservation Dept.

Puzzling Problems

By R. H. KASPER

1. A pole 40 feet long balances perfectly when supported 10 feet from one end, with 160 pounds placed on the short end. What is the weight of the pole?

2. A wholesaler bought a load of fruit for \$1500 and sold it at a loss of 5%. A retailer who bought \$500 worth failed in business, paying 45c on the dollar. What was the total loss of the wholesaler?

3. The total area of 2 square plots of ground is 193 square yards. The sum of all their sides is 76 yards. What are the lengths of the sides?

4. What number diminished by 28% of itself equals 1050 diminished by the same percentage of itself?

5. John has 3 times as much money as Fred, who has twice as much as Joe. Fred and Joe together have \$12 less than John. How much money has each?

6. A larger ball is equal in volume to 3 small balls. The smaller balls measure 3, 4, and 5 inches in diameter. What is the diameter of the large ball?

—For answers turn to Page 22.

So. Rutland Juvenile Grange No. 24 Wins Flag

AT the recent N. Y. State Grange Session held at Olean, honor pennants were given to twelve Juvenile Granges in the State that had fulfilled seven distinct points to qualify for this honor. The points are as follows:

1. Officers commit to memory the opening and closing ceremony.
2. All officers and members over eight years of age must commit the Juvenile pledge.
3. The Juvenile Grange must have initiated a class in full form.
4. The Juvenile Grange must have more members at the close of the year than at the beginning or have graduated a class into the Subordinate Grange.
5. Must have a worthwhile Lecturer's program at every meeting except on installation, initiation and election evening.
6. The Juvenile Grange must do some community work.
7. Prompt payment of dues to the State secretary.

Silk flags were also awarded the three Juveniles whose work as reported

to the State Master for the year was the most outstanding. South Rutland Juvenile No. 24 of Jefferson County by its outstanding work was fortunate to qualify for both honors. The beautiful silk flag was carried home from State Grange by the Juvenile Grange Deputy of the county, Mrs. Nellie Merrill. Ticonderoga Juvenile Grange No. 108 of Essex County and Warren Juvenile Grange No. 83 of Herkimer County also carried home beautiful silk flags. South Rutland Juvenile had a fine exhibit of some of their work at State Grange. This fine Juvenile Grange now has 66 active members and 16 honorary members. They have held twenty-four meetings during the year putting on many fine programs, entertainments, drills and exhibits.

The Juvenile Degree was put on in full form four times during the year initiating 34 members. The beautiful Juvenile tableaux were used during the degree work.

South Rutland Juvenile Grange No. 24 is one of the oldest Juvenile Granges in the State having been organized in 1922.

The Matron, or leader, during the past year has been Mrs. Earl Churchill who is an enthusiastic Granger. She has a genuine love for the Juvenile work and much of the success of the past year is due to her efforts.

Patrons everywhere are beginning as never before to realize the value of the Juvenile Grange. Many Subordinate Granges are giving their children this wonderful opportunity of learning the beauty of a true, honest and upright life, the necessity of kindness to others and the importance of working for the improvement of its members and the welfare of the Order.

—SUSAN W. FREESTONE,
Interlaken, N. Y.

Betty Award Certificates Ready

THE prettily tinted award certificates are now ready for all little cooks who have completed satisfactorily the two years' cooking lessons as given monthly in the American Agriculturist. Last year, we had a great many calls for our buttons with Betty's picture on them which were given to little cooks completing the first twelve lessons.

This certificate is the final award for this course and all that is necessary for you to do to get it is—first, to complete every recipe satisfactorily, and second, to get your mother or some other responsible adult to write to us saying that you have done so. Your name will be written on the certificate and it will be signed by Henry Morgenthau, Jr., publisher of American Agriculturist, and E. R. Eastman, editor.

A Conundrum

What state in the Union touches the most states?

Answer: Missouri and Tennessee each touch eight states.

—Photo, Courtesy N. Y. State Conservation Department
Ring-necked pheasants feeding on the snow.

project. To each of them who agrees to undertake the work, the Conservation Department will furnish three settings, totalling 45 pheasant eggs. The boy or girl agrees to hatch these, to rear the birds and to sell back to the Conservation Department all thrifty birds that have reached the age of seven weeks. The Department will pay \$1.00 apiece for all such birds and they will then be liberated in the neighborhood in which they were raised, or if this neighborhood is already especially well stocked with pheasants, they will be taken to some other neighborhood where the supply is not so ample for liberation.

The Department this year plans to keep in close touch with all persons, including the 4-H Club members, who undertake to raise pheasant eggs and to keep a check of the results of their effort. In distribution to individuals, it is probable that 4-H Club members will have first choice.

Experts of the Department agree with Club Agents who know the capabilities of their members that under average conditions the boy or girl who undertakes the pheasant project ought to have about 50 per cent as many pheasants at seven weeks of age as they have of eggs in the beginning, or perhaps twenty-two pheasants from each three settings of 45 eggs. Such a return from 1,000 individuals, or even

and a turn over that is remarkably quick in the business of agriculture.

It is the hope of Commissioner Morgenthau that the result of the experiment will be to make many or most of the boys and girls loyal and well informed conservationists for their whole lives. The work will not be undertaken in all of the counties of the State, since there are some counties in which pheasants have become so numerous that many of the farmers consider them a nuisance. To these counties no eggs will be sent unless there has been some specific arrangement in advance for distributing the young pheasants to areas where pheasants are scarcer and are desired.

The Department desires it to be noted that all applications for the pheasant eggs for the 4-H Club project must be made through the County Club leaders.

Each 4-H Club member will file an application blank for the eggs. This application blank must be approved by the County Club leader, or by the County Agricultural Agents in counties having no Club leader before the order will be filled by the Conservation Department. After that, the application is to be approved by the Conservation Commissioner and will constitute an agreement between the 4-H Club member and the Commissioner.

Two weeks ago a letter was sent to fish and game clubs throughout the

The South Rutland, N. Y. Juvenile Grange. Why not ask your Grange to organize one like it?

The natural demand of APPLE TREES is for CHILEAN the Natural Nitrate

APPLE trees respond quickly to fertilization with natural nitrate. Hundreds of tests prove it year after year. Chilean Nitrate of Soda is the one natural nitrate fertilizer. Nature made it...and Nature made it the best there is.

New Bag: Lowest Price

Now is the time to plan for early spring application to insure a good set and a healthy, profitable yield. Make no mistake. Use Chilean, the natural nitrate. Now for your greater convenience it comes in the new 100 lb. bag, *the bag without a backache*. The price is lower than in 25 years, combining economy with convenience. You can't afford *not* to use it.

Chilean Nitrate, due to its natural origin, contains rare elements—iodine, boron and magnesium. Each of these elements gives it *plus* value, for each is an important plant food in itself. Chilean isn't just nitrogen ... it is a super-nitrate ... Nitrogen PLUS.

Your dealer has a good supply. But order early to make sure to have your Chilean just when your trees want it most. It is supplied in two forms—standard Chilean (crystallized) and Champion brand (granulated). Ask for "Chilean," the natural nitrate.

Chilean Nitrate of Soda

Apples Need Cross Pollination

By H. L. COSLINE,
Associate Editor, American Agriculturist

FOR every apple that is picked next fall, a blossom must be pollinated this spring. This sounds simple but as study is given to the problem, New York State apple growers find it more and more complex. Years ago when the home apple orchards contained dozens of varieties, cross pollination took care of itself. Then as apple growing became more and more a commercial proposition, a drive was put on to cut down the number of varieties. The drive was very successful, but as new orchards (some of them solid blocks of one variety) came to bearing age growers began to complain that they did not bear. Now the need for cross pollination of most of our commercial varieties has been definitely established and growers are faced with the problem of how best to get it.

Thousands of orchardists have top-worked some of the trees, say every third tree in every third row, to a variety which will pollinate the remainder of the trees. Top working to provide cross pollination is the logical solution to the problem, but where a man has a solid block of one variety it will not be of any help to him this spring. Fortunately, some success has followed putting blossoming branches of another variety in the orchard. One orchardist in past years has secured good results by putting a large branch in the center of a square between each four trees. Others hang pails with branches in them in the trees or lean the branches against the side of the tree with the base of them in water. The next question is, what varieties should be used, either for top working, for cross pollination, or by means of branches left in the orchard?

Some common varieties that are regarded as self-sterile are Cortland, Delicious, McIntosh, Northern Spy, Rhode Island Greening, Twenty Ounce, and Wolf River. Others that are partially self-sterile, that is a much better crop will be secured by cross pollination with another variety, are Baldwin, Ben Davis, Northwestern Greening, Rome Beauty, Wagener, Wealthy, Yellow Transparent, and York Imperial. Certain varieties are reported by authorities as being unusually good pollinizers. Among this group are Delicious, Golden Delicious, McIntosh, Rome Beauties, Wagener, Wealthy, Yellow Transparent, and York Imperial.

Satisfactory pollinizers for McIntosh are Cortland, Twenty Ounce, Wagener, Delicious, and Oldenburg. Delicious blooms somewhat late for McIntosh. Cortland and McIntosh is a good combination for Rhode Island Greening. Where Rome Beauty is hardy it is the best pollinizer for Northern Spy. In the

colder sections Northwest Greening, Tolman, or Macoun are more satisfactory. In solid blocks of Seckel pears, Bosc is a satisfactory pollinizer.

Even where an orchardist has planted varieties that will cross pollinate, or if this was not done originally, has either top worked or provided blooming branches at pollination time, there is still an angle of the problem which is receiving a lot of attention. Bees seem to be the natural pollinating agents of apples and where there are no bees, the set of fruit will be light. Where bees are present and where the weather is favorable for even one day at just the right time during the blooming period, the pollination is usually good. Back in 1928 the weather during blooming time was especially unfavorable; in 1929 weather during the blooming season was fair, while last spring pollination conditions were good. As a result of good weather during the past two seasons there is probably not as much interest in the pollination problem as there was back in 1928. However, sooner or later bad weather will again be with us during blossom time and naturally, during such times the man who has conditions most favorable gets the best set of fruit.

Most growers know little or nothing about commercial bee keeping. Wayne County does have something over 600 apiaries, while Monroe County has around 400, and Niagara County close to 500. For the man who does not want to go into bee business there are several plans which may be worked with more or less success. In the past, some orchardists have rented enough hives of bees to enable them to place at least one to each acre of orchard. Rentals have varied to some extent, reports coming to us indicating that the range is somewhere between \$5 and \$10 per colony per season.

At first thought it might seem that bee keepers would welcome an opportunity to put a hive of bees in an orchard and that they should be able to make a profit from the honey the bees collect. It does not work out just this way in practice. Moving the bees is somewhat troublesome and takes time. The biggest drawback, however, is the heavy death rate to bees as a result of poisons used on apple trees in insect control measures. The bees do not always get the poison from the apple blossoms, but where the poison drifts from orchard to adjacent fields large numbers of bees are killed. Then again, another disadvantage concerns the danger of diseases. State inspectors in Western New York have found quite

(Continued on Opposite Page)

Loaded with blossoms that will never develop into fruit unless they are pollinated by another variety.

(Continued from Opposite Page)

a percentage of diseased bees and a bee owner who moves hives of healthy bees into an orchard runs the risk of having his colonies infected.

A second method sometimes used is to buy package bees, usually from Southern bee owners. These are put into hives with the idea of keeping them permanently or in some cases colonies have been destroyed following the blooming season.

Looking at the bee situation from the orchardist's point of view two difficulties are encountered, either the weather may be so cold during the blooming period that the bees do not fly, or the colony may be so weak that it does little work. Several suggestions have been offered as solutions of the problem. Fruit growers in a community might cooperate in owning a considerable number of colonies and employ a skilled beekeeper to manage them. Another suggestion is that orchardists in each community interest someone in going into the bee business for themselves with the understanding that orchardists will rent strong colonies at a yearly price which will return a profit to the bee owners.

One thing is sure; the problem is with us and deserves the closest attention and study from apple growers. The New York State college of Agriculture at Ithaca, N. Y., publishes bulletin P-497 on Apple Pollination which is free for the asking. We will be glad to have readers tell us their experiences either with top working, using branches of another variety for cross pollination, or by using bees to get a good set of fruit.

How to Control the Apple Aphis

ALMOST everyone is familiar with the aphid which is found in such profusion on almost all kinds of plants and shrubs in what is called an "aphid year". Some years the aphid does not bother to any great extent because conditions are adverse to its growth. When conditions are favorable, however, aphid seems to develop almost over night to an extent which is highly detrimental to flowers, shrubs, gardens and other plant life.

The aphid comes through the winter in the egg stage. With the coming of spring these eggs hatch, the young being 100% females and are called stem mothers. These stem mothers establish themselves on the tips of twigs and immediately begin producing young in great quantities. These in turn are all females and multiplication is continued at a rapid rate, the result being in favorable weather that the tips of the branches on the trees and shrubs are often actually weighed down by the volume. By some curious twist in nature a brood of aphid bearing wings is produced as soon as the quarters get too crowded in a particular locality. This winged brood establishes itself in new quarters and continues producing more and larger families.

Cool, moist weather is favorable to aphid and if Spring comes off with that type of weather predominating, aphid is soon seen in abundance all over the place. At such times a tobacco by-product spray, one teaspoonful to a gallon of water to which has been added a small piece of soap, used on the aphid immediately destroys them by the millions, however, there are always a few left in a "good aphid year," and successive sprayings will be required to keep the swarm at a minimum.

The years 1927 and 1929 were "aphid years" in the territory east of the Rocky Mountains. The aphid is a great enemy to the fruit grower because of its activity in the early season. The species known as rosy aphid is busy at work at the time the tiny fruit is making its appearance in the blossom. The aphid draws its sustenance through sucking sap or plant-juice much as the mosquito draws blood from an animal. Because of this fact the aphid will pierce the skin of the tiny developing fruit and draw sap from it. The result is what is known as an "aphid apple". These injured specimen never grow to large size and it takes 1500 to 1600 "aphid apples" to make a bushel.

**"15 acres of corn—
only 3 or 4 hills lost"**

—writes A. B. Wilmont, of E. Thetford, Vt. Crows and other pests had picked on his corn field—until he coated his seed corn with Stanley's Crow Repellent. No need to wait for Stanley's Crow Repellent to dry. Does not clog planter, nor injure corn. Non-poisonous. But absolutely keeps out moles, crows, gophers, squirrels and other pests. Large size can for 2 bu. seed-corn (8 to 10 acres) \$1.50. Smaller size \$1.00. If your hardware, drug or seed dealer hasn't a stock, order direct. Address The Cedar Hill Formulae Co., Box 500-M, New Britain, Conn.

New improved dip treats seed potatoes at One-Fourth Old Cost

This yield increase, of 19 sacks or 31 bushels per acre, was obtained by Improved Semesan Bel treatment.

Now there's a newer . . . cheaper . . . better way to treat seed potatoes! No soaking. Just *dip* them in *Improved Semesan Bel*—and plant!

A quick, easy process. So fast that one man alone can treat 300 to 400 bushels of seed per day. Yet it controls seed-borne scab and *Rhizoctonia* fully as well as time-wasting soak methods. And costs as little as 1½¢ per bushel of seed. Think of it! Less than the cost of corrosive sublimate treatment. A single pound now treats from 70 to 80 bushels—at only one-fourth the former cost!

Bigger Acre Yields

By killing scab and *Rhizoctonia* organisms on the seed, *Improved Semesan Bel* prevents seed rotting; produces stronger stands;

increases yields. Practical growers who tested *Improved Semesan Bel* during the past season obtained yield increases ranging from 13% to 20%. One grower writes: "In 1930 we had the best yield we have ever had, and I lay it entirely to your *Improved Semesan Bel*."

Treat All Seed

Good seed alone will not assure a good yield, for even certified seed often carries some disease. To be safe, treat all your seed with *Improved Semesan Bel*. You can treat for as little as 1½¢ a bushel. Even in very small quantities, the cost does not exceed 3¢ a bushel. Ask your dealer for free pamphlet, or mail a postcard today to the Bayer-Semesan Co., Inc., Dept. 64, 105 Hudson St., New York, N. Y.

Vegetable and
Crop Grower

Making the Oat Crop Pay

OATS are not a profitable crop on many Eastern farms. In fact, were it not for the necessity of rotating crops and having a nurse crop for the new seeding, there is little question but that the acreage devoted to oats would drop rapidly. We must grow oats or some other crop as a nurse crop so it is good business to get as high yields as possible, so that there will be no less and perhaps a small gain above the actual cash costs and pay for work.

Good yields are necessary to show a profit. Thorough preparation of the ground and early planting are important. Where experiments have been made a very definite relation has been found between earliness of planting and yield. Regardless of the date planted, there is a tendency for the oats to mature at a certain date.

Seed Treatment

Unless some plan is followed for the control of smut this disease is likely to cut yields considerably. It is relatively easy to treat the seed either every year or every other year as conditions warrant. Perhaps the simplest way is to buy 40 per cent formaldehyde, mix with equal amount of water, put it into a small hand sprayer, and then give two pumps of the handle for every shovelful of oats as some one slowly shovels the oats from one pile to another. After the pile of seed oats has been treated, cover it with a canvas for a few hours before drilling. One practice which is sometimes neglected is to run the seed oats through a fanning mill before treating them. The Geneva Experiment Station last year showed that out of 78 samples of seed grains inspected, 38 were absolutely unfit for planting because of wild mustard and quack grass seed.

Fertilizer

A little commercial fertilizer will start the crop off on the right foot. On farms where fertility has been well maintained, from 200 to 400 pounds of superphosphate may be sufficient. Where clover has not been grown or where applications of manure have been light, a complete commercial fertilizer, for example a 4-12-4 may be substituted. Lime is not so important for the oats themselves, but is frequently added for the benefit of the hay crop to follow.

Many dairy farmers in Eastern territory have increased their yields by substituting for the oat crop either a mixture of barley and oats, or a mixture of barley, oats, and peas. While lime is not so essential for oats, the barley and peas do not grow their best on soils that are too acid for red clover. A mixture of one bushel of oats and one bushel of barley or where the three grains are grown together, a bushel of oats, a bushel of barley, and a half bushel of peas is the usual rate of seeding.

Varieties

The New York State College of Agriculture has developed some high yielding varieties of oats. For general use, Cornellian is recommended. Other high yielding varieties are Empire, Comewell, and Standwell. Where oats and barley are grown together, two rows barley is recommended, which matures about the same time as oats. Alpha is one such variety. Canada field peas are used in mixtures and so far as we know, there are no recognized varieties of them.

The fertility of the soil needs to be considered in deciding just what combination to grow. Where soil is lacking in fertility it may be best to grow oats alone. A mixture of oats, peas, and barley is well adapted to richer soils which contain lime, should not be planted too early, and does well in warmer sections. Peas need to be planted deep on light soils and some-

times are planted first, then the oats and barley planted later. Where there is a tendency for the grain to lodge, the addition of peas to the mixture may cause trouble.

The editorial staff of American Agriculturist will be more than glad to answer your questions concerning your spring grain problems.

Gardening Made Easy

MORE and more emphasis is placed each year on the home garden, as people are becoming impressed with the value of a garden in supplying health giving foods at low prices.

Experiment station workers emphasize the desirability of including 30 or 40 different varieties of vegetables in the garden. Planting 40 rows of vegetables, the seed which varies from pin-point sizes, to the dimensions of an ordinary bean, is not such a welcome thought when work of digging the furrow, dropping, and covering must be done entirely by hand. Too often we are forced by lack of time to plant a row each of lettuce, radishes, turnips and peas with several others thrown in, and then call the garden complete.

To make possible a complete garden without undue labor or time requirement, makers of garden tools have spent years perfecting combination wheel outfits which can be used to harrow the ground, open the furrow, plant all varieties of vegetables, and then weed and cultivate them. Within a few minutes' time, one can change a one-wheel seeder which will drop in hills or drill in rows, into a two-wheel weeder with any type of blade or shovel one might desire.

In addition to these outfits, special rakes, toothed weeders, and pulverizers have been developed and fitted to handles, in the same style as the hoe, which of course is still an indispensable tool.

Fertilizer in Hill or Broadcast?

"Will you tell me the best way to sow fertilizer with potatoes? I want to run ten hundred to the acre. Will it be all right to drill it in first, before planting or run it in with the planter?"

It makes some difference what analysis fertilizer you are planning to use. Of course, with the newer concentrated fertilizers you would get on a large amount of plant food with this application and there might be some danger of injury if it were all put close to the seed at the time of planting potatoes.

Most potato growers who use an ordinary fertilizer; for example, a 5-10-5, feel that it is safe to apply up to fifteen hundred pounds per acre at the time of planting. Where growers use much more than fifteen hundred pounds they prefer to apply a part with the crop and a part of it either before or after the crop is planted.

Fertilizer Hastens Maturity

Is there any truth to the belief that commercial fertilizers will hasten the maturity of corn?

THIS depends to some extent upon the nature of the fertilizer. For example, it is commonly recognized that too heavy applications of nitrogen will delay maturity. However, we believe that there is little doubt that a well balanced application of plant food will hasten the maturity of any crop. Phosphoric acid is particularly important in this respect. The effect of fertilizer in hastening the maturity is borne out both by practical experience and by results secured by agricultural experiment stations.

Growing Alfalfa Seed

Is it possible to grow alfalfa seed in New York State?

THERE may be some question about the possibility of growing alfalfa seed in New York State. It has not been done very successfully, but it is possible that a variety will be found that will set seed under the rather humid conditions in New York State.

Let FARMALL Cut Your Costs

See the
McCormick-Deering
Dealer about
the New
Three-Annual-Payment
Plan

TO enable more farmers to reduce their production costs to a minimum this year we are now authorizing the most liberal terms on tractors and tractor-drawn and operated equipment ever offered by this Company. By these new terms any good responsible farmer can secure any McCormick-Deering tractor at once, together with equipment to be used with it, and spread the payments over a period of approximately three years.

These special terms, which are made to help place agriculture on a more profitable basis for 1931, are authorized for a limited time only. They apply to the McCormick-Deering 10-20, 15-30, and Farmall. See your McCormick-Deering dealer for full particulars.

1831-1931
McCORMICK REAPER
CENTENNIAL

WHEN you own a FARMALL Tractor you have the original, successful tractor for row-crop and general farming. The FARMALL and Farmall Equipment give you exclusive patented features and special advantages obtainable only in the McCormick-Deering line.

The Farmall has proved itself everywhere. It does the work of 6 to 10 horses and 2 to 3 men. It enables one man to farm a large acreage with no outside help. In a 10-hour day it plows 7 to 9 acres, double-disks 18 to 25 acres, and drills up to 45 acres. With a 2 or 4-row planter it plants from 24 to 46 acres. It cultivates 2 or 4 rows; with a 4-row outfit it cleans 33 to 50 acres a day, and, in

later cultivatings, 50 to 65 acres. It rotary hoes up to 50 or 60 acres. It handles all haying jobs, cutting a 14-foot swath with a 7-foot Farmall-powered mower and 7-foot trailer mower attached, and it also pulls rakes and loaders, and operates stackers. It operates grain and corn harvesting machines.

There is no substitute for the FARMALL and FARMALL Equipment. Their owners are producing crops at costs which range from 1/2 to 1/3 the government average for farms with similar yields. FARMALL owners make a profit even in adverse years. Plan to cut expenses this year with the FARMALL—see the McCormick-Deering dealer.

Dairyman

New York Dairymen Keep Records

By C. G. BRADT,
New York State College of Agriculture

NEW York State is taking steps to increase the number of cows in dairy record keeping work. The College of Agriculture and the Farm Bureaus have joined forces in promoting this important dairy project.

About a year ago, representatives of the College and the New York State Farm Bureau Federation met at Ithaca and adopted a dairy program for the year 1930. This committee of dairymen and college specialists received the whole dairy situation both present and future. It was this group's opinion that during the next year or two dairymen should follow a policy of retrenchment which would result in a lower cost of milk production. The keeping of dairy records on the farms of New York dairymen was the outstanding recommendation.

Results Now Showing

Since that time all dairy agencies have been emphasizing the value of milk and butterfat records on dairy farms. Results are beginning to show. At present, the number of cows in record keeping work stands at approximately 40,000. This is an increase of some 11,000 cows over a year ago. The campaign is to continue for another year. It is expected that the number of cows on test will reach 50,000 before the year 1931 closes.

New York State has two methods of record keeping which it is offering its dairymen besides the official records. The dairy herd improvement association is one method of record keeping which is meeting with success. The number of associations has increased from 50 to 68 in one year's time. The number of cows in dairy herd improvement associations now stands at 31,000 or an increase of 7,000 cows over the year before. The dairy herd improvement method of record keeping is now available to every one of the fifty-five counties of the state. It is growing steadily in favor.

Dairy Record Clubs

Another method of record keeping which is now being offered to New York dairymen is the dairy record club. This mail order plan of record keeping, although not new in some states is just beginning to be adopted in New York. The first year's experience in dairy record club work shows that it too, has a place on the farms of New York dairymen. This method shows much promise when dairymen become acquainted with its operation. Just now, the number of cows in dairy record clubs stands at slightly more than 5,000. From the interest which is being shown in the dairy record club plan, it is expected that 10,000 cows will be enrolled by the end of this year.

The dairy record club in New York State first started in a small way about certain milk plants. The county agents secured the enrollments and arranged with the milk plant manager for the testing of the samples. In some counties, a cow tester who had a few vacant days would handle all of the club work including the testing of the samples and the record keeping. Both of these methods worked satisfactorily when the number of club members was not great. At the present time, these systems are still being carried on in certain counties.

Recently, the dairy record club has taken on a new phase of development. Instead of having the testing and record keeping done at a milk plant or by a cow tester, a central laboratory plan has been established.

Central Laboratory Plan

This central laboratory arrangement operates in this way. A number of county farm bureau organizations co-

operate in setting up a central dairy record club laboratory which is conveniently located in the territory which it is to serve. Each cooperating county farm bureau guarantees a definite number of cows for this laboratory. The total number of cows guaranteed at a price of twelve to fifteen cents per cow per month covers the laboratories financial budget.

The supervision of the central laboratory is under a college trained assistant county agent who is responsible to a board of directors composed of representatives of the various county farm bureaus. A State College representative acts in an advisory capacity.

The central laboratory's function is to provide the record club service to members in the surrounding counties but each county must maintain its own enrollments and take care of all collections from members. Since each county has guaranteed a definite number of cows each month, little difficulty is experienced in enrollments dropping below the required number.

Laboratory Service

The record club laboratory takes care of the mailing out of the sample boxes to dairymen on one day each month. All postage both ways is paid by the Club. The member merely pays the twelve or fifteen cents per cow per month. The club also furnishes all mailing equipment, sample dipper, report sheets and file book for completed reports. All the dairyman needs is a milk scale.

When the dairy record club member receives his mailing case he knows it is time to carry out his part of the dairy record club plan. He weighs the milk from each cow, both night and morning and then takes the milk samples. He also records the amount of grain fed each cow, the percent protein, the price per ton and kind of roughage. The milk samples and the barn sheet are then remailed back to the laboratory.

At the laboratory, the samples are tested for butterfat and the records completed. On the completed reports the dairymen will have the pounds of milk for the testing day, the pounds of milk for the month, the butterfat test, the pounds of butterfat for the month and total milk and butterfat to date.

The dairyman also has a feed record too. The report shows the pounds of grain for the day, the month and the total to date. He is also given the pounds of grain fed per one hundred pounds of milk produced.

In order that the dairyman may check his production and feeding practice with that of other members, the club average for the previous month is given. If the club average is thirty pounds of grain per hundred of milk and this particular member is feeding but twenty-seven, he knows he is not as heavy a feeder as other members of the club. Figures are also provided on the report which will allow the member to compare his average milk and butterfat production per cow with that of the club average.

In addition to the milk testing and record keeping service, the club member receives farm visits from the laboratory supervisor. During these visits, the records are discussed and suggestions made which may be helpful to the dairyman in improving his dairy practices.

Three Central Laboratories

At present in New York, three central dairy record club laboratories have been established. The laboratory at Middletown serves the counties of Orange, Sullivan, Rockland, Delaware, and Suffolk. The counties of Columbia

Ever look into a cow's stomach?

Of course not! But if it were possible you would be amazed at what goes on there!

You'd rush to the nearest feed store for Dried Molasses Beet Pulp—the natural vegetable feed resulting from the extraction of sugar from beets—the feed that keeps the cow's stomach in perfect working order. In addition to being a great feed itself it aids the digestion of the other ingredients in the ration.

Dried Molasses Beet Pulp is *bulky, cooling, laxative, palatable*—just the kind of feed every cow needs in her stomach to keep in perfect health. And your cows must be healthy to be profitable. Fits any ration—replaces corn, barley, oats, silage and other carbohydrate feeds. 6 pounds are equal to 10 pounds of hay. Good for all animals—dairy cows, beef cattle and sheep.

Attractive Prices

Present low prices make it more than ever a profitable buy. See your feed dealer without delay. Shipments made direct from factory closest to buyer.

Send for Free Booklet, "Profitable Feeding"

THE LARROWE MILLING COMPANY
Dept. A-6 Detroit, Mich.

Left: Dried Molasses Beet Pulp before it is moistened.

Right: Note how it swells after water is added. Loosely held together it is digested to the utmost.

Good Silage

isn't just a matter of chance. In the Unadilla, succulent, sweet and productive silage is a matter of certainty. With its air-tight, water-tight staves and doors, feed settles compactly and cures evenly. And the heating and fermenting processes are of course aided by this air-tight wooden construction.

Buy a Unadilla and know real silo service. Write Today for our big catalog and details on Cash Discounts for early orders and Time Payment plan.

and Dutchess also will soon be sending work there.

In Western New York, the Gowanda laboratory serves the counties of Erie, Cattaraugus, Chautauqua, Livingston, Wyoming and Genesee.

The Central New York laboratory at Ithaca has been doing record club work for Tompkins, Cayuga, Chenango, Monroe, Ontario, Seneca, Schuyler, Yates, Onondaga, and Steuben Counties.

With this system of central laboratories, one might say that the laboratory with the lowest price per cow would eventually drive the other laboratories out of business. No difficulty has been experienced in this respect. One reason is that the price does not differ greatly in any of the laboratories. Three cents per cow is the greatest difference just now and it is expected that by another year the prices will be uniform. The service is handled on a strictly non-profit basis. Increased volume will eventually mean lower costs of operation and lower prices for the dairyman.

At the present time, the dairy herd improvement associations and the dairy record clubs in New York are meeting the demands from dairymen for record keeping service. The association may interest one dairyman and the dairy record club another. By having two types of record services to offer, it is expected that the number of cows in record keeping work will greatly increase during the coming year.

Making Milk and Money With Alfalfa

(Continued from Page 3)

that was sown back in 1926 and it is still cutting a good crop but we will plow it under next year, as after five years I think that a field becomes too badly weed-infested to be satisfactory. Many of the farmers in this section are sowing alfalfa with their clover and getting fairly good results. I think this is a good practice and the increased value of the hay and the addition of the nitrogen to the soil seem to pay for the extra cost of seeding. I personally prefer a number of fields, sown without a nurse crop early in July and the crop left down for about five or six years. By sowing a few acres every year, my total yield does not change much and I am always sure of plenty for my winter dairy." Mr. Jones said as we walked down to a lower field where one of his sons was dragging with a tractor.

Preparing the Seed Bed

"We just finished draining this last year," he continued, "so we will be seeding as soon as we get the rest of the first cutting in the barn. We plan on dragging about once every ten days as soon as we can get on the ground in the Spring until the seed is sown. We have tried seeding with oats but believe that we can get best results by seeding alone. Of course, we lose the use of the land for one year but we can cut one crop and find that we can get a more even stand. We use 15 pounds of inoculated seed per acre and have always had good results.

Inoculation Pays

"Do you think inoculation pays?" I asked.

"Well, we tried seeding without it one year and made up our minds that for the small extra cost we would not take any more chances. We only had half a crop that year and it has been about the only time that we have not had a success with alfalfa. We had one other bad year when a field that was very wet, winterkilled quite badly, but as a rule we have had just as good luck with alfalfa as we used to have with clover. And you should see the difference it makes in the milk check. Why, when we first started feeding alfalfa, we didn't have enough to feed through the winter. We had the alfalfa in the middle of the mow and when we started feeding it, the cows gained right away and when it was gone we just stopped sending a couple of cans, that's all."

RABBITS AND SUPPLIES. COMPLETE LITERATURE 5c.
ALBERT FACEY, JR., INC., 115-AA, Valley Stream, N.Y.

ket opened with a fractional decline in sympathy with the weakness at Chicago. The drop was a quarter of a cent. This slight reduction was sufficient to bring out the buyers and establish a steady tone at the revised figure. On Tuesday the market held steady at 28c for 92 score with values fairly well sustained. Buying was not particularly active but first hand receivers thought well enough of the situation to hold prices unchanged.

On Wednesday a slightly easier tone was in evidence and creamery extras went down to 27¼c. This brought out a wider buying interest and before the close of the day prices were bid back to 28c. Thursday's market held steady but trade was not active although supplies about balanced the demand. It is quite evident that operators are not prone to disturb the price level. On Friday trading fell off late in the day, and an easier tone developed ending up in a decline of ½c. Chicago again was influential, values there dropping to a new low point. This created a lack of confidence among the New York operators and the market sagged.

During the week the supply of the cheaper grades of butter has continued relatively short. Held butter has been experiencing a little more pressure, although values are still pretty close to fresh stock.

Indications are that the market is going to continue in this same tone. Business conditions are about the same as they have been and butter is one of those staples that is being used to attract trade. As long as butter is being used as a business getter there is little likelihood of any material improvement in the price. Obviously, this is unfair to the dairy interests. At the same time, it is keeping stock moving. If the tables were turned and the price were advanced we would soon see rapid accumulations and further complications

Cheese Drops Lower

STATE FLATS	April 10, 1931	Apr. 3, 1931	April 11, 1930
Fresh Fancy	14-15½	15-16½	18-18½
Fresh Average			
Held Fancy			
Held Average	21-22½	21-22½	24-26

The weakness that we reported in the cheese market last week has continued and prices have sagged downward. On Monday, April 6, the downward trend carried fresh New York State whole milk flats to 14½c and 15c. On Tuesday reports were current in the market that some sales of fresh State flats from up-state were below existing reduced quotations in New York City. At the same time these same goods were finding very slow outlet in the Metropolitan market. This condition continued on Wednesday and Thursday. On Friday, a further weakness developed that brought the inside price on fancy fresh State flats to 14c.

While fresh cheese has trended downward, cured cheese has held fairly steady, although, business is principally in small lots.

Eggs Gain, Then Lose

NEARBY WHITE	April 10, 1931	Apr. 3, 1931	April 11, 1930

Henney	23 -25	25 -26	29½-33
Gathered	20 -22¾	21½-24	26 -29

The egg market fluctuated widely during the week ending April 11. On Monday, Tuesday and Wednesday prices advanced from 25c on closely selected extras up to 26c. On the first two days receipts were rather light. In fact, on Tuesday supplies were considerably lighter than last year. On Wednesday, there was an increase in supply and although the top quotation was at 26c, later in the day some of the top selections were available at 24½c. Thursday's market was unsettled and the general price range for closely selected extras was 24c to 25½c. Receipts were showing a material increase, exceeding last year's figures. This situation continued on Friday. The heavier supplies and increased movement into the warehouses had a direct effect on the market. At the same time, the post-Easter distributing trade has fallen off materially and the market is showing more dependence on the speculative buyers who

are willing to store the surplus. The unsettled condition carried prices down to 23c-24½c on closely selected extras on Friday. Nearbys are running into a lot of difficulty because receivers are not inclined to store nearbys except the very choicest selections. The result is that prices were again cut in an effort to turn goods. Even some high cost premium Jer; seys have suffered this fate. Pacific egg producers are shading their prices on the intermediate grades but in spite of that spot trading is not active.

	12-13	15-16	18-19
GESE			

The live poultry market has suffered rapid price changes that have characterized other lines of merchandise. The market opened up on Monday, April 6, with a sharp break in fowls. Colored fowls were slow at 24c while Leghorns were selling well at 22c. Broilers were moving very actively with Fancy Rocks going as high as 45c and the best Reds at 41c. However, this price was too extreme and practically shut off business causing heavy losses on Tuesday all around. On Tuesday prices dropped sharply all along the line, buyers refusing to take hold, except at their own figure. Wednesday was another very slow day. Very limited demand. Fortunately receipts were light. Slaughter houses were reporting slow killing. On Thursday there was a swing back and fowls regained a better position reaching 23c to 24c on colored stock and 22c to 23c on Leghorn. Broilers were getting more call but Rocks could not do any better than 40c. On Friday, colored fowls were still bringing 24c in a steady market, although heavy stock was not doing so well. Leghorns were in active demand at 24c to 25c. Broilers also improved with 42c on the best Rocks and 37c on the best Reds. All indications were that the market would wind up at these prevailing figures.

The next special market comes next month on May 22-23. The Hebrew Holiday, Feast of Weeks, will call for prime quality poultry. The best market days will be May 19-20 and shipments should be timed to arrive early on those days. Decoration Day comes on May 30 when live broilers and other lines of prime quality poultry will be in demand. The best market days will be May 26-27 and 28. Stock arriving late on the 28th may be a little too late.

Hay Prices Easier

We have had fairly liberal receipts of hay during the week ending April 11, and these combined with a less active demand have caused the market to sag \$1 per ton. Most of the offerings have been from No. 2 to low grade mixtures. Timothy grading No. 1 brings \$26 to \$27, No. 2 \$24 to \$25, No. 3 \$22 to \$23. Timothy containing a light mixture of clover sells over a range of \$20 to \$25, with grass mixtures from \$1 to \$2 less depending on the grade. Ryc straw has been in good demand during the week and prices are now \$15 to \$16. Oat straw is doing a little better and brings \$12 to \$13. Wheat still sells at \$12.

In the Produce Market

Old potatoes are quiet and not showing much change. In general they are holding fairly steady. Maine potatoes in 150 pound sacks are bringing from \$3.15 to \$3.50, while Long Islands in the same size package are bringing from \$3 to \$3.40. The Long Island deal is about cleaned up and the mild weather isn't helping the stock that is being held. Last week we drove through some of the potato country on the "Blessed Isle," as Hal Fullerton calls it. The new crop is rapidly going into the ground. It will not be long before the entire crop will have been planted.

Fresh receipts of old onion stocks are light and good stock is turning slightly

firmer. Eastern yellows are bringing up to \$1.25 per 100 and Reds \$1.10.

State cabbage is bulk is bringing from \$19 to \$21 per ton. The market has been more or less draggy.

Carrots are moving slowly. State stock is bringing from 40c to 80c per bag.

Dandelion greens are not getting much attention. hey are coming all the way from Texas, Florida, South Carolina and Jersey. They are quite neglected, although some Jersey stock is bringing as much as \$1 per basket, while that which is not so good is only worth two shilling. Nearby turnips that are nice are bringing from 75c to 90c per basket.

Bean Market Slow

Dull trading still features the bean market. Trade is weak and irregular and prices are not at all settled. The general range of quotations is as follows: Jumbo Marrows \$4.75 to \$5.50; Average Marrows \$4 to \$4.65; Pea Beans \$4.25 to \$5; Red Kidneys \$8.25 to \$9.25; White Kidneys \$6 to \$6.75; Round Cranberries \$5.25 to \$6.

Meats and Livestock

CATTLE—No steers offered. Light run of cows about steady. Common to medium 4.00-5.00. Low cutter and cutters 2.00-3.50. Bulls steady. Cutter to medium 4.00-5.25.

VEALERS—Slow, 50-75c lower. Medium grades off most. Low grades little changed. Good to choice 8.00-10.50. Mediums 6.50-7.50. Cull and common 4.00-5.00.

HOGS—Around 25c lower. Good to choice 180-225 lbs. averages 8.25-8.50.

COUNTRY DRESSED CALVES—Receipts were liberal during the week. Trading slow all through. Friday's receipts were moderate and buying slow. Prices were lower and irregular Market closed weak and not cleaning up. Fresh receipts per pound: Choice 10-11; fair to good 8-10c; small to medium 4-8c.

HOTHOUSE LAMBS—Receipts liberal during the week. Demand fair. Market closed weak at 5.00-9.00 each; imitations, each 2.00-4.00.

LIVE RABBITS—Receipts moderate during the week. Demand slow to fair at irregular prices. Market closed weak at 15-20c per pound.

MAPLE SYRUP—Steady; United States Commercial Standard, graded and filtered per gallon: No. 1, 2.25-2.35; No. 2, 1.75-2.25; No. 3, 1.65-1.75 (Farmers run equivalent to No. 3) Sugar in casks, farmers run 20-25c.

WOOL—New York better fleece wool, unwashed, fine, per pound: 20-30c, ½ blood 20-26c; ¾ blood, 20-23c; ¼ blood 17-22c; low quarter blood 17-19c; common and braid 17-19c.

ROOTS AND HERBS—Wild Ginseng selling very slowly. Well dried, New York and Eastern States, per pound: \$10.50, cultivated Ginseng, according to quality, 3.00-7.00 per pound for New York and Eastern States. Goldenseal: Clean and well dried, N. Y. and Eastern States 90c per pound; Goldenseal: Leaves and stems New York and Eastern States 10c per pound.

Wayne County Heavy Shipper of Vegetables

AN item of interest to the Wayne County shippers is the report that in 1930, 12,149 cars of fruits and vegetables were shipped. Estimates made by the New York State College of Agriculture would add thirty per cent to this carload total for the produce trucked to local markets. New York City, Philadelphia, Pittsburg and Cleveland received most of the produce shipped from Wayne County.

Four thousand four hundred and ninety-five cars of fruit and 7,645 cars of vegetables were shipped. It would take a mile long train daily for four months to move the fruits and vegetables that were shipped last year from this up-state section.

A. A. markets are broadcast from WEAf from 12:45 to 1:00. As soon as daylight saving time goes into effect, they will be broadcast still from 12:45 to 1:00 daylight saving time.

Farm News from New York

Legislative Session Comes to an End -- Good Year for Agriculture

THE New York State Legislature ended its session on Friday, April 10th. Serving in the Legislature is a hard, thankless, and poorly paid job, and the Assemblymen and Senators are always glad when the sessions come to an end and they are able to return to their homes and to their regular duties.

The Legislature this year did a fairly good job for agriculture. Governor Roosevelt's Agriculture Advisory Commission and the farm organizations thought it was a good year to go slowly in asking for new legislation, and not very much, comparatively speaking, in the way of new laws was asked for. However most of that which was requested by agriculture passed the Legislature. Practically all the important bills which were up for consideration were summarized on the first page of our March 21st issue. Many of the bills which were passed by the Legislature have not yet been signed by the Governor, so they are not yet laws. When they are all signed, we will print another complete summary of all the agricultural legislation in an early issue of American Agriculturist.

One of the most important bills passed during the latter days of the session and immediately signed by the Governor was an act amending the agricultural and markets law, prohibiting the use of color in oleomargarine to make it look like butter. In signing this bill, which the Legislature forwarded to him after passage for his approval, Governor Roosevelt said:

"A very significant tendency has been manifested in recent years for margarine to exhibit a new color guise, in many instances so closely approximating the characteristic color of butter as to be indistinguishable except through the use of laboratory methods. Through certain improvements in the art of processing fats and oils which are used in the manufacture of margarine, there is now cheaply available a limitless supply of margarine ingredients which will result in a finished product having a consistency and color simulating those properties of butter.

"The time has unquestionably arrived when this State should declare in plain and unmistakable language that butter substitutes which exhibit those shades of yellow which from time out of memory have been associated in the public understanding with butter should be elim-

inated from the channels of trade. The bill before me will, I believe, accomplish this objective and therefore to prevent consumer deception and to safeguard the dairy industry from unfair competition, I approve it."

The dairy industry of the State is indebted to both the Legislature and the Governor for passing this measure. The new law is in line with the Federal Law passed by the recent Congress, prohibiting the use of color in oleomargarine so that it imitates butter.

Health Bill Amended

A REPORT from Albany states that the proposed health bill has been amended in several important points.

Columbia County—Warm spring days half of last week and windy, rainy March weather the other half.

Copies of old time quilts are being sold in a Hudson store under name of Colonial Quilts. To be used as both a quilt and bedspread.

Fox farms are again advertising for horse meat. Many farmers are selling their old faithful horses to them. Others consider they deserve a burial perchance on the farm where they have worked faithfully; many are born on the farms where they finally finish their career.

1600 trout were freed in Chatham Center Creek last year, which were furnished by Conservation Department to Chatham Rod & Gun League and were of a new variety for that section; they are known as steel head. Now the trout season is again open. "Variety is the spice of life" perhaps to trout fishermen as well as others.

Hudson schools have chosen May 1st as Arbor Day.

Shoals will be cleared from Hudson River this month between Germantown and Heath; then there will be a 27 foot channel up the river as far as Albany. Some farmers ship by boat.

Eggs 25c a dozen.—Mrs. C. V. H.

Sullivan County—April so far has been a growing month, warm rains and not freezing much nights to hurt seedlings. Farmers are busy building fences, trimming tiles, and doing up odd jobs

Doctor Livingston Farrand, president of Cornell University and head of the New York State commission, has been urging the setting up of county health units throughout the state as part of the twenty-year plan for health promotion. Despite the recommendations of the commission a Republican majority in the Assembly passed a bill last Wednesday that omitted the section that had to do with these suggestions. The Governor in a special message to the Legislature censured the position taken and stated that the bill was cut due to fear by local politicians that they would lose some minor patronage. The state is in urgent need of some kind of a health program, especially in our rural sections and it would seem that some method like that

proposed by the health commission would prove a solution to the problem.

Hunting Dates Made Uniform

THIS year the sportsman will not find it necessary to keep a half-dozen opening dates in mind when he goes out to hunt game, as a new law was signed last week that provides for a general opening of all game seasons on October 26. The season on deer, bear, squirrels, rabbits, partridge, and pheasant will open on this date under the provisions of the new law.

Another innovation is the consolidating of the pheasant season into the last six week days in October, instead (Continued on Page 21)

New York County Notes

before the real rush begins. Many will not raise chicks this year because of high price of feed and low price of eggs and fowls. Much hay is being bought this year which costs from nine dollars to twelve dollars per ton. Cows are selling at almost any price, all depending on their age, condition, and how much milk they produce. Butter is 30 cents a pound, eggs are 20 cents to 25 cents a dozen.—Mrs. P. E. R.

Western New York Notes

A big gas well whose flow is estimated at 6,000,000 cubic feet daily, has been drilled between Perrysburg and Smith's Mills.

Daylight saving will begin in Buffalo, Sunday morning, April 26th.

On April 2nd, Olean experienced the worst snow storm of the past winter. It took one life and did thousands of dollars damage in the city and vicinity. Hundreds of trees snapped beneath the weight of the wet snow, and telephone poles and wires crashed under the strain.

At the request of District Attorney Guy B. Moore, the Erie County Board of Supervisors has voted to appropriate \$25,000 for his use in continuing the investigation of town and county highways.

The sixth annual Western New York Music Festival will be held in the auditorium of the Fredonia Normal School from April 26th to May 1st.

Results of the campaign in Cattaraugus County for clothing and food stuffs for drought sufferers were double what was expected, so that two cars were sent instead of one.

James Davis, assistant extension forester from the College of Agriculture at Ithaca will visit Wyoming County 4-H Club members April 8th to give instruction in regard to their second year forestry program. A field trip will be made during the day and weather permitting, an outdoor meal served.

Western New York Granges were well represented at the School for Grange Lecturers recently held at Ithaca.

Western New York territory contributed large delegations of Senior class members to the "High School" special of several sections on the trunk line Friday, bound for Washington, D. C.

More than 620 schools have entered the National Spelling Bee, conducted in the eight counties of Western New York by the Buffalo Evening News, and as schools have until April 17th to enroll the number will be very likely be still larger.

Last year a pupil of the Mt. Hope Indian School, Tuscarora reservation, was Niagara County champion. This year the schools of the Allegany reservation have entered the contest.

Many interesting letters from principals and teachers give testimony as to the worth of the contest. It has proved a wonderful way of arousing interest in a subject that is not very inspiring. Children are working much harder because of this incentive, and there is a marked improvement in spelling standings.

Any of you old boys and girls re-

member "way back when" the school "spelled down" every Friday afternoon?

Ontario County—We had a very heavy week's snow storm that filled the cross-roads with huge snowdrifts. It took nearly a week before they were all opened up to traffic. It made employment for those without work, as they work night and day shifts.

The long drought has been broken, and we have plenty of water for stock, which is very much appreciated. Stock is doing very good. Farmers are busy pressing hay and doing odd jobs.

The conditions of farming do not seem to improve as they should. Farm produce continues low, while farm wages are still high. Many are doing without hired help, thus curtailing expenses. Grange work in the county seems to be progressing. On March 28, Wide Awake Grange of Phelps, held their fortieth anniversary in the fine Community Hall at Phelps. There were eight different Granges represented. The Worthy State Overseer, Raymond Cooper, was guest of the occasion, and gave an interesting talk.—E.T.B.

Cattaraugus County—The county Farm and Home Bureaus asked that one carload of clothing and food be donated and sent to the drought sufferers of the south. Randolph township, the home of Senator L. G. Kirkland, offered with the aid of Coldspring, Leon, Conewango, and Dayton to make up a car of their own. They did, and on April 4 it was sent to Elizabethton, Tennessee. The rest of the county, farms and villages including the cities of Salamanca and Olean sent on the same day two cars instead of one. The cars were filled with hundreds of pounds of clothing, potatoes, carrots, flour, eggs, butter, sugar, and coffee besides a large amount of canned fruit and vegetables. One was sent to Chase City, Virginia, and the other to Pineville, Kentucky. Those assisting the Farm and Home Bureaus in the work of charity were the granges, farmers and business men, and the county highway department in collecting and furnishing trucks for the transportation of the donations to the cars. The Erie Railroad furnished the cars and transportation to destination free. There is no greater act of charity than relieving the distresses of our brothers and sisters.

Mrs. Lena C. Freeborn, Randolph, has been appointed clerk of Cattaraugus County by Governor Franklin D. Roosevelt following the death of W. T. Eldridge. The offices are in Little Valley, the county seat. She was the candidate of the Democratic party last November. Her husband died about a year ago. She assumed her new duties the second week of April.

A former World War veteran, George Mullen, 30, was instantly killed by falling on a buzz saw while assisting cutting wood in the town of Napoli. He slipped on the ice. Parents, widow and two children survive.

The snow, nearly gone, has brought the water back to brooks and streams. —M. M. S.

Hewitt Amendment Passed by Legislature

THE Hewitt reforestation amendment received final legislative sanction last week when the Assembly voted approval of it for the second time. Having already been passed by the Senate, the amendment now is assured of going on the New York State ballot for the November election, when, if it receives popular approval, it will become a part of the constitution.

Governor Roosevelt and legislative leaders hailed the passage of the amendment by the legislature for the second time as an important step toward the achievement of the comprehensive program of rebuilding into productive forests of the denuded timber lands of New York State and creating a permanent resource of valuable timber and forest products.

The amendment authorizes appropriations totalling \$20,000,000 over a period of twelve years, at the end of which time one million acres of abandoned and unproductive lands will have been planted in forests of commercial value and availability.

In addition the amendment deals specifically with a reforestation policy for the sixteen counties in the Adirondack and Catskill regions which are legally designated as forest preserve counties. It will permit the acquisition of abandoned land within these counties but outside of the lines of the Adirondack and Catskill parks for production forests; that is, plantings in which timber may be cut and sold for commercial uses, when it reaches the right stage of maturity. The law as it now stands

would not permit such productive use of lands acquired for forests in those counties.

The sixteen counties contain altogether thirteen million acres.

As a result of the recent enactment of the law extending the "blue line" of the Adirondack Park five million acres are now included in the two parks, but eight million acres remain, embracing large areas of unused land suitable for forest and available for acquisition by the State.

Commenting on the passage of the Hewitt Amendment and the "blue line" bill Governor Roosevelt said:

"The green slopes of our forested hills lured our first settlers and furnished them the materials of a happy life. They and their descendants were careless with that asset. Those who found abundance in New York state were no different from the rest. Once there was a great wealth of timber here. Now we have great barren areas where productive forests once stood."

"But modern progress in agriculture has conferred an opportunity on us. Intensive modern farming goes to the fertile plains of broad extent and rules out stubborn acres stolen from the forests. Annually hundreds of thousands of acres in this state are being abandoned for farm use. We propose to put them back as fast as we may into their natural and profitable use—the use for which Nature intended them—of growing trees for us."

H. E. GASTON,
Secretary Conservation Dept.

DAIRYLEA

Dried Skim Milk

A Quality Product For Poultry, Calves, Pigs

DAIRYLEA Dried Skim Milk in poultry rations, insures growth and health. Strongly recommended by feeding authorities. The ideal food for growing chicks. Increases egg production and improves hatchability in layers and breeders. Also excellent for calves and pigs. Manufactured in plants of the Dairymen's League Cooperative Association, Inc. from the same high quality milk that is approved for New York City. Guaranteed by years of careful laboratory analysis and experiment.

Carried by local feed dealers and feed stores. If there is no representative in your town, order direct from New York office.

Packed in 100 lb. bags and 150 lb. Barrels

Fill out coupon and mail today A.A. Dairymen's League Cooperative Association, Inc. Room 2140, 11 West 42nd St., New York City

Please send free bulletin and prices on Dairylea Dried Skim Milk.

The Best Way to Feed Poultry

By L. E. WEAVER
A. A. Poultry Editor

L. E. Weaver

PROBABLY no two persons use exactly the same plan of feeding poultry. Some have better results than others. This may or may not be due to the way the feeding is done. A plan that works for one may not be so good for someone else. In a radio talk, Dr. Norris of the Cornell Experiment Station has pointed out that there is no one best way of feeding. The all-mash plan may give just the same results as the scratch-mash plan. The most important requirement seems to be that the birds actually consume a given amount of a balanced ration. That last statement deserves a great deal of emphasis. It is sometimes said that it costs no more to keep a good hen than it does a cull. That is not true. A good layer does eat more than a poor layer and costs more to feed her, of course. But she pays for all she eats and more. And the cull does not. One hundred leghorn pullets will eat about 16-18 pounds of grain and mash per day when they are not laying. We call that their maintenance requirement. They need that much feed to just keep them in running order. Now let them get up to 50% production and they will be eating 24-25 pounds per day. It would seem then, that 6-8 pounds of feed are needed to produce about 4 dozen eggs or perhaps 2 pounds per dozen. If the owner does not get that extra feed into the pullets, he won't get the eggs.

Keep Conditions Right

With all conditions correct, it is not a difficult matter to get the pullets to keep up a continued high food consumption, and consequently, a good egg production. Very often, however, all conditions are not correct, and then the poultryman must resort to various means of tempting the birds to greater consumption. Some of the disturbing factors that are very common in our eastern states are: damp and drafty poultry houses, poorly-grown pullets, "wormy" pullets, chronic coccidiosis, chickenpox, overcrowding, and just poor breeding.

Before taking up a discussion of methods, there are some other considerations that it is well to mention. First, the matter of the amount of labor involved. With the same amount of help, one farm will keep twice as many hens as another. The layout of the plant and systematizing of the work are important factors in the differences in labor efficiency. But another big factor is the method of feeding. For instance, hopper-feeding of grain requires much less labor than hand feeding.

And another fact worth careful thought is this: The better bred the hens are from a production standpoint, the easier it is to get good results from whatever method is used. It takes more to upset them. They will not be so easily thrown out of balance by changes of feed or irregularity of feeding or by zero weather.

Doing Work Easily

Now, with those items in mind, let us suppose we have everything just as we would like it—a bright, roomy, and well ventilated house; a well-bred, well-grown and healthy flock of pullets; and a ration with plenty of milk in it as well as complete in every other detail. Now, we want to feed with the least outlay of labor that is justified by good judgment. How will we feed them? Dry mash in non-

wasting, non-clogging troughs, of course. And open all the time. The caretaker will see to it that the mash does not accumulate and become stale in the bottom. The grain, too, will be hopper-fed. That saves labor, is vastly more sanitary and safer than litter feeding, and moreover, it gives just as good results, and probably better. We are talking about feeding pullets. For older birds, there may be some question of their getting enough exercise. With pullets, that does not appear to be an important factor.

Now, as to whether or not the grain hoppers should be left open all the time as the mash and oyster shell hoppers are, there is still some question. Personally, with conditions as we have outlined them, I would leave them open all the time. I have seen at least 3 flocks where that practice has been followed and always with excellent success. In every case, however, the pullets were from pedigreed ancestry. With more ordinary stock, I am inclined to think there might be another story. In case it seems best to restrict the grain feeding, some arrangement will have to be devised to close the hoppers or troughs during the forenoon, perhaps.

Next, the pullets will be given a moist mash once a day, at noon or later, whichever time fits in best with the other chores, but of course, every day at the same hour. Some may say, "I thought you wanted to save labor." But I also know that the records of prosperous poultry farms prove that poultry men are paid more for their time spent in feeding wet mash than for most anything else they do. Some have even found that it paid to feed wet mash twice a day.

How to Feed the Moist Mash

The term "wet mash" is commonly used but "moist mash" is more accurate. The mash should be just well dampened and crumbly. Probably, the best way of feeding it is in V-shaped troughs that are placed on the floor at feeding time. They are then put back on racks at the end or side of the room and out of the way until needed again.

Some people, in order to avoid the bother of handling the troughs feed the moist mash on top of the dry mash in the open troughs. This works well, provided one is carefully seeing to it that no mash stays in the feeders more than a day or two at a time. I have been very hesitant about suggesting this plan ever since I saw several places where in hot summer weather, too much moist mash had been fed. It had been left long enough that moisture had soaked down through the dry mash and the whole mass had become musty—a big waste of feed and a dangerous source of trouble from digestive disorders.

One more chore is the feeding of the green feed. The forenoon is a good time for that. Here it will pay to restrict the amount fed. Five pounds per 100 birds per day are plenty if it is cabbage, carrots, etc. Clover or alfalfa hay in a rack may be fed unrestricted.

All-Mash Feeding

The foregoing discussion has been based on the assumption that the pullets were accustomed to a ration combining grain and mash feeding. That is the system of rearing recommended by most of our eastern Experiment Stations and the one most commonly followed. It is not possible as a rule to get good results with all-mash rations from pullets so reared. They seem to miss the grain and do not eat enough mash. Where chicks have been grown all the way through on an all-

New York State Needs Regional Markets

(Continued from Page 3)

trate for a moment on the lettuce and tomato sandwich and see what regions provide the delectable vegetable constituents during all of the months of the year. First directing attention to tomatoes, from September to November, we draw our supply from far away California; from December to May, we go even farther afield, calling insistently upon the Bahama Islands, Cuba, Mexico and Florida. In June, Mississippi contributes her quota, and for the remaining months of July and August, New York and her fond sister state (New Jersey) dominate the market. Lettuce is available the year round without drawing from foreign countries. For ten months in the year, the California gardens can be depended upon to furnish the vitamin-yielding lettuce. The California shipping season covers the period from December to September. During portions of this period Arizona, Florida and North Carolina help California to carry the burden, and from July to October, New York and New Jersey ship mountains of lettuce.

New York City demands annually ten thousand carloads of lettuce, drawn from fifteen states, New York contributing 2000 cars to be compared with 5000 cars from California with its wide range of climate extending from the near tropical to the near polar and its consequent long production and shipping season.

To meet the demands of the almost insatiable maws of the teeming millions of people in the metropolitan districts of New York, 210,000 cars of fruits and vegetables are required annually, equaling 700 cars per day for each business day.

When the remarkable growth in population of New York State is drawn into consideration, resulting in a population of twelve millions of people within the state, and an additional three millions living in neighboring areas, whose food supply is largely from New York City, one would think that the New York farmer occupied a decidedly enviable position and that agriculture should be one of the most profitable of industries; and that might well be true, except for the phenomenon of artificial refrigeration.

The 210,000 cars of fruits and vegetables consumed annually in New York City would, in themselves, make a tidy business if all were turned off New York State's many acres, but the fact is that of this vast total, but eight per cent of the fruits, and twenty per cent of the vegetables originate in the Empire State. Each year, twenty-five states and three foreign countries ship potatoes; sixteen states and three foreign countries are shippers of cabbage, and cantaloupes come from nineteen states and three foreign countries. Truly, New York City's taste, like many other of her attributes, is cosmopolitan. California, literally, is the market basket of New York City, being responsible for forty-six different fruits and vegetables, and approximately one-third of the total incoming tonnage.

Through the revolution of artificial

refrigeration, New York farmers have lost a large part of their advantage of position in proximity to the great consuming centers, and they suffer the very real disadvantage of being well in the rear in the seasonal order of production. As a single illustration, by the time New York State peaches have reached maturity, the peach lovers of New York cities have been feasting upon the alluring fruit for nearly four months, and it is not surprising that by the end of that period the consumer urge for peaches is markedly dull.

There is another revolution in progress of significance to agriculture, and it may be well to examine that revolution to see what it may have in store either of good or of evil for agriculture. At the moment I am referring to the tremendous changes being wrought in the substitution of mechanically propelled vehicles for those drawn by horses. For over thirty years we have been engaged in the development of a system of hard-surfaced highways. Originally these improved arteries were referred to as market roads. During the past twenty-five years motor trucks have become a common phenomenon. Due to the combination of hard surfaced roads and swift moving trucks, foodstuffs, including those of highly perishable character, are drawn to the markets of this state from distant production points.

At certain seasons of the year market trucks in New York City from as far away as North Carolina are not an unheard of occurrence. Motor trucks, at the same time, are serving a highly useful purpose for the movement of New York State products. A recent study of a single market in New York State (that of the nearby City of Albany) indicated that over a thousand motor vehicles were customarily operated in connection with the market. Some of these trucks range the countryside gathering in the products of the farm and bringing them to the market for sale. Other trucks were of the inter-city variety, purchasing upon the Albany market and proceeding to other city markets to find outlets.

Hard-surfaced highways and motor trucks in combination offer great possibilities to New York State farmers, but those possibilities cannot be completely realized unless terminals of the proper kinds are established in the important cities of the state. Nearly all of our large cities have markets of one kind or another. In the main, these markets were located years ago and have little relation to the needs of the present day. For the state to put millions of dollars into market highways and make no provision for destination markets would be like completing a railroad and providing no terminals.

A large part of the food supply of the state will, of course, for all time be brought in from distant areas. This, notwithstanding the growth of trucking, will continue to be principally a rail movement. The railroad companies are alive to the necessity of providing mod-

"Reminds me of the day after Thanksgiving."—JUDGE.

Builds Early Profit Makers

These birds, fed exclusively on B-B, were raised in a battery brooder and have never seen direct sunlight. But because of the high vitamin content and perfect balance of B-B feed, they weighed 2½ pounds each when photographed at 12 weeks of age!

CONCLUSIVE tests prove that B-B Vitamized All-Mash Chick Starter Ration produces 26% extra weight during a chick's first six weeks! After that, B-B Vitamized Broiler and Growing Ration takes up the job, developing the growing birds into vigorous big-boned pullets or plump, heavy cockerels.

B-B Vitamized All-Mash Broiler and Growing Ration has all the Vitamins, minerals and health-giving concentrates required by the growing bird, such as Milk Sugar Feed, Cod Liver Oil, Dried Buttermilk, Alfalfa Leaf Meal, Linseed Oil Meal, Meat Meal, Fish Meal and other ingredients that produce extra weight, better bone development and added vitality.

Poultrymen who use B-B Feed find that their birds reach the money-making stage at an early age. "At 12 weeks, my 100 birds raised on B-B feed average 3 pounds in weight," writes Paul Van Hanczheim, Walworth, N. Y. "I sold 2-pound broilers when my cockerels were 9 weeks

old," says A. W. Early, Fairport, N. Y. E. R. Stiles, of Portland, Me., says "I had white Wyandottes dress 2½ pounds when 8 weeks old and pullets from the same lot start to lay when 19 weeks old."

Guaranteed Results

To prove that B-B Vitamized All-Mash Broiler and Growing Ration will give you best results, we make this offer. Get a supply from your dealer. Feed it to a part of your hatch and compare with any feed you choose to use for the balance. If B-B doesn't produce more vigorous pullets or heavier cockerels bring the empty bags back to your dealer with your figures and he will return your money.

Another feed that we particularly recommend to poultrymen at this season is B-B Broiler and Crate Fattener, a feed for finishing off birds before marketing. Tests prove that this remarkable feed adds 30% to 50% of weight in 10 to 16 days!

Many poultrymen are having excellent results with B-B Daisy All-Mash Starting and Growing Feed and we recommend this to feeders who want a good ration at an exceptionally low price. We supply it either with or without Cod Liver Oil. You can feed B-B Daisy All-Mash at lower feed cost than you can mix your own ration.

mash ration, they can be continued as layers on all mash and will respond apparently as well as the others. The all-mash system effects still further savings in labor and time.

New York Has a New Trespass Law

(Continued from Page 1)

to posting, but when it is necessary to post, we now have a law that is fair by putting all trespassers on the same basis. Even after the land is posted, we cannot conceive of a farmer prosecuting a decent citizen who may be found walking upon posted land if he has conducted himself as he should. We would hate to see the law enforced to the letter. That is not the idea.

The thought back of the new law, however, is to put the burden of the proof upon the trespasser and not upon the farmer. Under this new legislation, if a man ventures upon posted land, he had certainly better conduct himself as a privileged guest or he will get into trouble.

The new law was greatly aided in its course through the Legislature by Assemblyman Ellis W. Bentley, Chairman of the Committee on Conservation, and by Senator George L. Thompson, Chairman of the Senate Conservation Committee. Both of these men—in fact, both committees—realize the importance of giving farmers more protection against trespassers under these new modern conditions that are developing, whereby so many people are running about the country. We are glad to say, also, that the Conservation Department and many of the leading sportsmen's organizations gave their approval to this new legislation.

The new posting legislation of New York State is in line with legislation which other neighboring states have been forced to adopt. New Jersey, for instance, has a law which reads in part as follows:

"It shall be unlawful for any person or persons to trespass upon the cultivated lands of any other person or persons within this State after public notice on the part of the owner..... forbidding such trespass."

In other words, this is very similar to the one we now have in New York. New Jersey like many sections in New York State is becoming largely urban. Probably many farmers who live back away from the cities wonder why all of this excitement about trespassing. They would not wonder long if they lived near a city.

Pennsylvania has a special trespass law covering both trespassing and the stealing of farm products. Connecticut has a written-permission law. We do not believe this would be very practical for New York State farmers. Very few have time to bother to keep handing

out written permits. They would soon get in the habit of telling trespassers to go ahead without a permit and this would lead to a breaking down of the law.

Our every contact with the better class of sportsmen shows them more than willing to cooperate with farmers and their organizations to protect the farmers' property rights. We know that most farmers will meet these good sportsmen and other guests more than half way. Our thought is that if a hunter or fisherman has the decency and courtesy to come to the land-owner and ask permission to go on the land, then the land-owner should grant such permission whether the land is posted or not. The law is for protection against trespassers who will not cooperate and who seem to have no regard for property rights.

New York State Needs Regional Markets

(Continued from Page 15)

ern food terminals. This is indicated very clearly by what is taking place in Buffalo, where opposing groups of carriers are providing competing food terminals. Competition in certain lines has its advantages, but there is nothing but disadvantage in the duplication of primary food markets in any city. The ideal arrangement is a single joint terminal to which all railroads have access on equal terms and which is supplemented by a farmers' market at which the products of nearby origin can be bought and sold.

In Buffalo, both groups of carriers are directly or indirectly providing facilities for farmer markets, and if there were in Buffalo but a single food terminal with adequate farmer market facilities, all would be well. But it ought to be self-evident that New York agriculture cannot depend upon the carriers to provide everywhere farmer markets. Railroads, of necessity, secure the bulk of their revenue from the transportation of merchandise, and it would be just a little too much to expect that railroad management will be so altruistic as not to look with more favor upon commodities moved in over their own rails, rather than those brought in by trucks. And it would seem therefore to be an enlightened public policy for the state to see that there is provided adequate food terminal facilities in all of the principal cities in order that there may be equality of opportunity between food produced in distant areas and brought in over the rails of carriers, and that of nearer origin, brought to the mart in motor trucks; and if New York agriculture is to maintain its competitive position in relation to producers in distant areas, such facilities must be provided.

How to Cook Vegetables

Follow These Hints and Tempt Your Family's Appetites

BRIEFLY put, vegetables which grow above the ground should be cooked uncovered, those from below the surface should be cooked covered. The presence of acid or long cooking is the enemy of green color. Yellow vegetables, such as carrots, sweet potatoes, and squash, do not lose their color easily and respond well to the pressure method of cooking. White vegetables are apt to become gray or brown from over cooking. Green vegetables have their color intensified by alkali fumes, red by acid fumes, while yellow vegetables are affected but slightly by either alkali or acid. Any vegetable should be cooked for as short a time as possible, in order not to destroy vitamins or to make the vegetable mushy. A small quantity of baking soda provides the alkali which keeps the green color but the soda should be used in moderation because it is destructive to the vitamin content.

The acid necessary for keeping red cabbage or other vegetables red is provided by adding small amounts of vine-

to see a plate containing carrots, beets, and tomatoes? But no one would object to seeing any one of these vegetables combined with green peas and potatoes. Such combinations not only are more pleasing to the eye, but are more tempting to the appetite and are more desirable from the point of view of nutrition.

If the meat is cold, that calls for a different type of vegetable also. French fried potatoes, potato chips, or creamed potatoes go nicely with a cold meat, while plain boiled or baked potatoes are more desirable with hot meats accompanied by gravy.

Avoid Home-Made Look

IT is not necessary for home made clothes to advertise that fact to the world, according to Miss Mildred Carney, clothing specialist, at the New York State college of home economics. Proper tools and proper handling may produce a very finished garment from the hands of the home dressmaker.

A well oiled sewing machine in perfect running condition is the first necessity. Straight sharp needles properly adjusted, thread of the same kind and number on the top and on the bobbin, (evenly wound) are also necessary.

A well-equipped tool box would show tailor's chalk, small rulers, sharp shears, scissors, steel pins, pincushion, needles of various sizes, thimbles, tape measure, thread, emery, yard stick, cardboard for gauges in measuring hems, a pencil and milliners' needles.

But it is the pressing, or lack of it, which will betray the amateur. Good pressing requires the proper equipment. This is an ironing board which is well padded, clean, smooth and firm, pressing pads for pressing curves and seams, and a smooth iron. Miss Carney says get the habit of pressing and then keep on doing it, pressing everything, every place and every time

that it will help. Use a moderately hot iron on a damp pressing cloth. Lift the iron gently over the material, using a patting motion.

Artistic Porch Boxes

THE preparation and arrangement of a porch or window box tests the cleverness of the gardener, says Professor M. A. McMasters of Cornell University. There is no more pleasing decoration for the house than artistic boxes of plants used at the windows or on the porches, he adds.

The location of the boxes should be suitable and the composition should be in scale with the house. For a large home it may be necessary to group or mass the boxes. For small houses such an arrangement would be out of place. First, choose the right color of container for the color of the house, he says. Then choose plants with blooms that produce either pleasing harmony or a striking contrast. A white house with white boxes is well set off with Balcony Blue petunias alone, the rich, deep purple blooms being contrasted by the white background.

Use Few Colors

Nasturtiums and the orange-yellow marigolds are attractive in boxes on green-colored houses. A box planted entirely with nasturtiums, the dwarf varieties in back and the trailing ones in front, gives a beautiful effect. Two or three well-selected colors are better than many different kinds. There can

The problem of exposure must be met with appropriate plants for the location. For the shade, the following flowering plants may be used: Begonia semperflorens, the tuberous rooted begonia, pansy, snapdragon, lobelia, aster, fuchsia, and Cobes scandens. Foliage plants for the shade are vinca, foliage geranium, croton, English Ivy, ferns, asparagus sprengeri, and coleus.

The following flowering plants grow well in sunny situations: geranium, pe-

tunia, ageratum, candytuft, English daisy, heliotrope, marigold, nasturtium, phlox, verbena, cobea scandens, lobelia, lantana, and sweet alyssum. Foliage plants for the sunny side include: German Ivy, wandering Jew, vinca, asparagus, coleus, dusty miller, and pyrethrum.

The wooden box is the most desirable for it can be made to harmonize with the house easily; it is cheap and easy to handle. Several coats of paint inside and out will increase its durability. No box should be less than six inches deep, eight is better, and the

HIGH CHAIR PAD NO. B5528 comes stamped for quilting on tinted percale in pink and yellow. Padding and binding for the strings are included in the package. Price \$1.00. Order from Embroidery Dept., American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

width may vary from six to nine inches. To avoid "wet feet" bore several half-inch holes in the bottom of the box. These holes should be partly covered with pieces of broken pots to prevent the soil from sifting.

Because immediate effects are wanted the boxes are usually crowded. This requires a rich soil to produce a stocky, healthy growth. A box five feet long will benefit from a three or four ounce application of fertilizer every three weeks. A thorough soaking should be given after each fertilizer application.

Whenever the soil becomes dry, water should be applied in sufficient quantity to cause the surplus to run off through the holes in the bottom.

Don't Wait Till You Die!

LAST summer nearly two hundred Nebraska farmers made a joint vacation tour of the Pacific Northwest, an experience which they will never forget. There was one farmer near Lincoln, Nebraska, who derived the keenest enjoyment from reading about the tour in his local farm paper, which had promoted it.

He read every word of the advance notices, and every word describing the tour itself. He thought what a wonderful education it would be for himself and family to take this trip through Nature's Wonderland of the Far Northwest. But he took it only in imagination. He decided that he could not afford it, and did not go.

Recently this man died. When his will was read, it was discovered that he had left a considerable amount of money in trust for the specific purpose of giving his children an educational trip every year. Evidently he could have afforded it. And how much more the children would have enjoyed a trip with Dad along!

This is a true story, and there is a moral in it. If you can possibly afford it, take the wife and children on our farmers tour of Yellowstone Park and the Northwest this year. If you can't make it a family affair, take the wife on that long-deferred honeymoon, and let the kids await another time. But don't wait till you die! Write American Agriculturist 461 4th Ave., New York City for information about the A. A.—Yellowstone tour from August 1-10.

Animal Alphabet

These initials are designed to use as embroidery patterns on things for children, on pockets, romper yokes, napkins, pillowcases or any other place for which the size would be correct.

Each letter is grouped with an animal or bird of that initial.

These letters of the alphabet are all on a wax transfer sheet as number M323.

M323 Wax Transfer of alphabet 25c.

Order from Embroidery Department, American Agriculturist, 10 N. Cherry Street, Poughkeepsie, N. Y.

gar or lemon juice to the cooking water.

Vegetables such as cauliflower, turnips, onions and cabbage require large quantities of water and should be cooked uncovered so that the strong flavor may escape in the steam. The water in which vegetables are cooked contains some of the mineral salts from the vegetables, in addition to the flavoring and therefore makes a very delightful addition to soup stock. In fact all water in which vegetables are cooked should be considered valuable and should be treasured for adding to soups, stews, or gravies. Water in which potatoes are cooked may be used the next day for cooking onions or other potatoes.

Have the water boiling vigorously before putting vegetables into it and cook until they are just tender; salt is added after the vegetables begin to be tender.

Choosing the right vegetables to serve with meats is a real art. A delicately flavored meat requires a delicately flavored vegetable, whereas a strongly flavored meat seems to demand a more strongly flavored vegetable. For instance, chicken being a mildly flavored meat, would be entirely submerged by smothered onions or sauer kraut, but its flavor is enhanced by green peas or asparagus. Lamb, beef, steak and ham all have pronounced flavors and at least one of the vegetables served in a meal with these meats should be decided in flavor.

Another thing to be considered in combining vegetables with the rest of the meal is the color. Who would want

Noon-day Lily Quilt

READY cut quilts save you all the tedious marking of materials and endless cutting of hundreds of small pieces. The assortment comes to you complete, all of the pieces accurately cut of best quality percale, guaranteed color fast. A detailed chart shows exactly how to sew the pieces and quickly make up the quilt.

Noon-day Lily is a charming example of patchwork and applique combining to form this lovely pattern. The flower units piece; leaves and stems applique onto background and the whole sets together diagonally, so the lilies will grow up, with alternate plain blocks between.

The colors in which we are cutting this number are pink and rose com-

binning in each flower with green leaves and white background. The blocks finish 12 inches square and you may order one ready cut block with back and boxing to make a quaint patchwork pillow as No. M300X at 50c. Or material for a quilt top to finish 85 inches square, all parts ready cut of fine fast color percale in the same dainty colors in No. M300M at \$4.00. This is for 25 pieced blocks and the alternate plain white blocks for the complete quilt. Pattern only is in our patchwork booklet No. M631D, which also contains eleven other patterns at 15c for the group.

Aunt Janet's Corner

Teacher--Why Do You Teach?

There is nothing wildly thrilling and romantic about teaching and yet when you think of the wonderful teachers that have risen above their fellows from time to time, we can appreciate the value of a good teacher in developing the minds of the young. Professor William Lyon Phelps of the English Department of Yale University is one of the outstanding teachers of this age. It is significant to know how he regards the profession of teaching.

—AUNT JANET.

I DO not know that I could make entirely clear to an outsider the pleasure I have in teaching. I had rather earn my living by teaching than in any other way. In my mind, teaching is not merely a lifework, a profession, an occupation, a struggle; it is a passion. I love to teach. I love to teach as a painter loves to paint, as a musician loves to play, as a singer loves to sing, as a strong man rejoices to run a race. Teaching is an art—an art so great and so difficult to master that a man or a woman can spend a long life at it, without realizing much more than his limitations and mistakes and his distance from the ideal. There never has been in the world's history a period when it was more worthwhile to be a teacher than in the twentieth

century; for there was never an age when such vast multitudes were eager for an education or when the necessity of a liberal education was so generally recognized. It would seem as though the whole world were trying to lift itself to a higher plane of thought."

—WILLIAM LYON PHELPS.

Liquefied Gas

THE Bureau of Standards, Department of Commerce, at Washington, has made available for distribution a "letter circular" considering the various liquefied petroleum gases. This circular is of particular interest to people who are contemplating the use of a bottled gas for cooking purposes in the home. The gas companies and dealers were quick to see the value of the information contained in this circular, but home owners have not made much use of it so far. It can be obtained by writing to the Bureau of Standards and asking for the abstract on bottled gases.

Tourists Accommodated

WHENEVER I see a tourist sign, I either mentally or orally bemoan the luck that placed our big, roomy farm house too far from the tourist trail, for me to cash in on this popular business.

Members of my family, growing tired of hearing me talk about tourists, pointed out the ever-increasing signs and questioned the profits. Fired by their remarks, I began an investigation of the tourist trade with the following results.

First I talked with everyone I knew who was renting rooms to transients, some of them farm women, and some village dwellers—I found that their success financially was in direct ratio to the attractiveness of their surroundings, except one woman who served such excellent meals that her fame was passed on from town to town, tourists driving long distances to spend a night at her home. Her house was ordinary, rooms not especially well furnished, but those wonderful meals brought her an endless stream of lodgers.

Then we went on a long trip ourselves, staying at tourist homes entirely. I always talked shop with the woman of the house and asked lots of questions. In every case, we found the attractive, well-kept houses succeeding in spite of competition. At the unattractive places, I heard various reasons for lack of customers—times were hard, tourist business failing, and so on and so forth.

We were entertained in many very beautiful homes; one was really luxurious. It was in a large village and our hostess had evidently been the leader of the local four hundred, but most of their wealth was invested in farms and the agricultural depressions had brought sharp reverses. She was a woman of about sixty, her husband older, and frail. They apparently lived in kitchen and dining room and the rest of the house was open to tourists. We stayed two nights and she had at least ten others each night. An unusually pleasant porch, nicely furnished was a great drawing card, I thought. It looked so inviting to us as we drove past, tired and warm after a long dusty drive.

The rooms were comfortable in every way, good beds, of course, and small conveniences so much appreciated by the weary travelers, coat hangers, towel rack on door of clothes press, hot water and good lights in each room and a table or desk arranged for writing. Her prices were higher than many, the cheapest room being \$1.50 per person, but apparently it was cheerfully paid.

A friend of mine cleared four hundred dollars in one season. Her house is pleasant, back from the road in a well kept lawn, a screened porch, garage room, electric lights, bath with plenty of hot water. Although on a farm she

served no meals, but surroundings were ideal.

Another friend of mine told a different story; her house was large, but in poor repair, and very close to the road, fewer conveniences and as an added attraction she served meals. In one season she kept just twenty-two guests.

People will not stop at an unattractive place unless forced to do so.

The tourist business is a boon to women who desire to add to the family income without leaving home. The roads are full of automobiles, especially through summer months and all houses along the traveled routes have the opportunity to benefit from the

For the Little Girl

3049

DRESS PATTERN NO. 3049 offers excellent opportunity for using the popular tri-color scheme in a cunning jumper dress. Gingham with pale blue ground, overlaid in navy blue fine stripings and using plain blue bindings nicely set off the white batiste guimpe. Other three-color combinations are equally good. This charming little outfit cuts in sizes 2, 4 and 6 years. The 4-year size requires 1½ yards of 39-inch material for dress with ¼ yard of 35-inch material for blouse and 2½ yards of binding. Price, 15c.

nomads. To the casual observer, it would seem that the demand would soon be over-supplied and then it will be a case of the survival of the fittest.

From my personal experience as a guest, I should say that the main requisites are, first, attractive or at least neat, outside appearance, electric lights, if it is a community where others have them, clean comfortable beds, cool, airy rooms with screens for windows and above all, hot water, and facilities of some sort for baths. If you live on a traveled road and are possessed of the above mentioned items—hang out your sign and rest assured your friends and acquaintances on the back road will be green with envy.

—COUNTRY CONTRIBUTOR.

Creamed Mushrooms

Brown one can of mushrooms, or one pound of fresh ones in a little butter. Make a white sauce of four tablespoonfuls of butter, four tablespoonfuls of flour, two and one half cupfuls chicken or veal stock, one-half teaspoonful salt and one-fourth teaspoonful pepper. Remove from fire and stir in a beaten egg and the mushrooms. Just before serving, add one teaspoonful Worcester-shire sauce, one tablespoonful shredded pimiento, one tablespoonful chopped green pepper, one teaspoonful parsley, one tablespoonful stuffed olives cut in halves and two small sweet pickles quartered lengthwise. Serve on toast. —L.M.T.

For Miss or Small Woman

3061

JACKET DRESS PATTERN NO. 3061 is very smart this Spring. Navy blue wool crepe adorned with bright red buttons and with a red patent leather belt would be very much in the season's mode. This pattern also lends itself nicely to the heavier silks. This style cuts in sizes 14, 16, 18, 20 years, 36 and 38-inches bust measure. Size 16 requires 4¼ yards of 39-inch material. Price, 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the new Spring Catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

The Story Thus Far

Jim Stuart sees a drifting canoe. He and Omar, his Indian guide, start out at considerable risk and rescue the person hanging on to it. They find it is a girl, the daughter of LeBlond, the head of the rival trading post. Omar's wife, Marthe, thoroughly disapproves of the knickers Aurore LeBlond is wearing.

Jim's next trouble is how to get her home. It was impossible to cross the lake; it is miles around and Jim feels that LeBlond will not be pleased to have his daughter stay at his rival's camp. Aurore seems to approve of Jim and there are indications that the approval is mutual.

* * *

They sat down at the table and the square-built Sarah appeared, her copper skin red from cooking, a large pink bow bobbing bravely from her dusky braids. With a withering look at Jim's guest from her small eyes, she deposited a dish of steaming caribou stew, to be followed by broiled whitefish, hot biscuit, tea and wild strawberries.

"Dear me, but I'm hungry!" exclaimed the girl, as the outraged and inquisitive Ojibwa woman, hands on hips, boldly scrutinized her from bobbed hair to whipcord knickers—to gain a better view of which the cook coolly stepped back and circled her chair. "Marthe gave me some broth but I'm famished, and this stew smells so good."

Then, aware of the exhaustive inspection from the rear by the fascinated Sarah, the girl rose and turned to the gasping cook: "Would you like to see my knickers?" she asked, wheeling on her toes. "You don't wear them do you? You'd find them very comfortable."

Choking with confusion, the overwhelmed Sarah fled to the kitchen, while Stuart shook with laughter.

Gibodiegwason

"You're too much for Sarah. She was certainly hypnotized by your gibodiegwason."

"My what?"

"Your gibodiegwason—your pan—whipcords!"

"Mon Dieu! Are they as awful as that?" she cried, overcome by the Ojibwa equivalent. "What did you call them? Gibo-di-what? No wonder Marthe and Sarah are shocked! Think of a woman wearing anything with such a name! Gibo-di—" and she broke into shouts of laughter, while he watched the rich color flame in neck and face, the flash of white teeth, the dark eyes fill with the tears of her merriment.

"Gibo—" Aurore LeBlond rocked slowly back and forth in her chair.

"Gibodiegwason," he repeated.

"Gibo-di-eg-wason!" she faltered, breathlessly, "gibos, for short! Wait till they hear that in Winnipeg! They'll never wear 'em again!"

Stuart regarded his guest with unconcealed curiosity. Buried in the hinterlands since the war, he had had no contact with the new girl. But now, it appeared, he was being offered a rare opportunity for the study of the species.

"There won't be much left of me when Sarah and Marthe get their heads together, but you're not really

shocked, Monsieur Stuart. With us, all women wear them for sport."

"No, indeed, I'm not shocked," he laughed, his eyes shifting from her dusky head to the well-shaped hand busy with her fork. "We saw lots of them in France. But I'm wondering just how your being here will strike your father."

She looked up, quizzically, tea-cup suspended in air. "You think my father will be ungrateful to you for pulling me out of the lake?"

"He's trying to drive me out of the trade here." He rose and went to a window opening on the lake, where the wind was cutting off the foaming tops of the grey combers. "It's going to blow all night, Miss LeBlond, and I don't see how we can get you home."

Her eyes followed him to where he stood, back toward her. From his moccasined feet her appraising gaze lifted to the generous spread of shoulder, the bronzed neck above the collar of his woolen shirt, the crisp brown hair.

"So you're worried over what Marthe and Sarah will think if you can't rid yourself of your guest, Mr. Stuart?" she suggested with a curl of a full red lip.

He turned to meet her amused eyes. "I'm wondering how your father will take it. How will he like it when he learns that you've been here?"

She shrugged, "My father adores his unworthy daughter. He will love you for what you did this afternoon. The poor man must think I'm in the lake, now. He'll be insane with worry! Poor Dad!"

Stuart scowled with impatience. "Are you never serious, Miss Aurore LeBlond? You may ignore the facts but he won't. You French are careful—of appearances. If I thought I could

get you safely over there to-night we'd start now."

The blood drove into her olive skin. "It's you who seem careful of appearances. You—you are bored with your guest, Monsieur Stuart. Let us go then!" She rose stiffly, her face flaming with outraged vanity.

But he ignored the challenge. "A boat wouldn't live out there now."

"Then I shall go by shore."

With hands on hips he smiled indulgently at the indignant girl who confronted him. "Do you realize how far it is through the bush?"

"No, and I don't care so long as I leave this place where I seem unwelcome."

Twenty Miles by Land

"Well, it's a good twenty miles, and it'll be dark in an hour. Have you ever travelled in the bush at night?"

Ignoring the question she contemplated Marthe's beaded moccasins as she curled and uncurled her toes in their capacious interiors. Then her black eyes lifted to the man who watched her, ill at ease, as her face lit in an amused smile. "Have you really been so bored, Mr. Stuart?"

He laughed in relief at her change of mood. "Do you think I have? Is it likely that a man marooned up here in the bush would be bored with Miss Aurore LeBlond?"

"That's rather half-hearted, isn't it? Can't you do better?"

"Yes, I can do much better," he teased, "but I don't think it's good for you."

"You think I'm vain?"

"I know you are."

She nodded as she moved about the room. "That's true. I am. Father's made a fool of me—"

They turned at a knock on the outside door of the house.

"Come in!" called Stuart.

Omar's broad face thrust through the doorway of the living room.

"You spik wid me?" he asked of Stuart, with a sidelong glance at the girl.

Nodding, Stuart turned to the girl with, "You'll excuse me?" and left the room.

"What you do wid her?" demanded the half-breed, as the two walked to

Jim Stuart.

American Agriculturist, April 18, 1931 the rear of the building out of the wind.

"What can we do, Omar? We can't push a canoe across the lake into those seas, and we can't take her through the bush—the swamp at the outlet. She's got to stay until the wind drops."

"You don't know Louis LeBlond," muttered Boisvert, ominously. "Eef she stay here dis night it mean troubl' for you and me."

"I know he'll not like it, but you think he won't show any gratitude for saving her life?"

"Eet mean troubl' for you and me," repeated the other, stolidly.

"All right, let it come then!" angrily answered the trader. "A little more won't hurt us. We can't get her home to-night in that seventeen-foot Peterboro, and we can't put her out in the bush, can we? She's got to stay here. If he wants to make trouble,—let it come!"

Stuart left the half-breed and entered the house. "Miss LeBlond," he said, "there's no trail along-shore, and there's a swamp at the outlet where you'd be eaten alive by mosquitoes. To start with our small canoe means filling, in a mile or two!"

She studied him with sober face; then, thick brows knotted in a mock frown, she demanded: "You're not trying to deceive a defenceless woman, whom fate has thrown into your hands? Oh, sir, somewhere in your black heart there must linger a trace of pity, of honor. Spare my tender youth!"

With a muttered exclamation of irritation, he turned to the window and gazed out where the running seas grayed in the fading twilight.

"Well, anyway, whether you're a villain or not," she continued, "I don't intend to swamp in that lake in the dark and get wet again. Oh-h-h! It was cold! It makes me shiver to think of it. And besides," her eyes flashed with humor, "suppose my what-you-call-'ems, my gibo-dieg-wason, shrank? What should I do?"

The man at the window remained motionless, but his hidden face went red in his attempt to suppress his laughter.

In secret satisfaction she watched his shaking shoulders, then said: "I like your back, Monsieur Stuart, but I think I prefer your face."

He swung on her with a smile of surrender. She was incorrigible—this daughter of LeBlond.

"They knew you took a canoe?"

"Yes, but they may think I landed on an island and couldn't get back. By the way, do you happen to have such a thing as a cigarette? Mine were water soaked."

"Yes, such as they are. But you'll find them pretty poor." He went to his bedroom and returned with a package.

Personal History

"Now," she said, when he had given her a light and filled his pipe, "tell me about yourself."

"There's not much to interest a lady from Winnipeg."

"Try me. You came here three years ago to start a post for the Hudson's Bay Company. I know that much. Father was here first, for his North-West Trading Company, and, naturally, didn't like it."

"Yes, that's right." Now that the matter was settled and Aurore LeBlond was to stay at Sunset House, the curious trader thrust aside the responsibility assumed by her presence, and revelled in the picture she made as she smoked in his chair.

"I've heard so many terrible things about you," she went on, "that I've been gasping to learn just how much of a liar Paul Paradis was."

"So—Paradis has been blackening my reputation, has he?"

"Blackening is mild to what he's

(Continued on Page 22)

Farm News from New York

(Continued from Page 13)

of the scattered four days it has been the past few years.

Another item of interest is the fact that venison may be cut up and transported if properly supervised and tagged. Formerly it has been necessary for the sportsman to transport the entire carcass of the deer if he wished to take any home. This has been hard on other members of the party who often have hunted for days and have been obliged to see all the meat obtained taken home by the lucky man who shot the deer.

Fishing Season Opens

A WEEK ago Saturday officially opened the trout fishing season in most of our New York streams. It also opened the official season for fish stories. As usual, the biggest fish caught on the opening day were those that got away. But some prominent sportsmen reported excellent catches.

Most of the streams in the state are still very high, and for a while at least, the garden or night-walkers will be the best bait available. We can remember fishing in a small stream in the Adirondacks, when all we had to do was to put a large lively worm on the hook, drop it in the stream, and we would pull out a ten-inch rainbow trout. One day in particular, we remember fishing for trout from 6 o'clock in the morning until 10 o'clock and had our creels full. Incidentally, this is not a fish story.

Speed Limit Raised

LAST Wednesday the state Assembly passed a bill raising the speed limit on state highways from 30 to 40 miles per hour. It has often been felt that the present speed limit is a farce in the open country, and has often been a bone of contention between motorists and local officials. It is hoped that the new law will make for better traffic conditions especially in our congested urban counties.

A.A. On the Radio

WEAF—Each week day from 12:45 to 1:00 P. M. the New York State Department of Agriculture and Markets, cooperating with American Agriculturist, broadcasts market reports.

WGY—On Wednesdays during noon programs, usually at 12:25 P. M., Radio Station WGY broadcasts each week Eastern Farm News prepared by the Editorial Staff of A. A.

On Monday at 12:25 P. M., an editorial under the heading: "Editor Ed Looks at Life", prepared by Mr. Eastman, is broadcast.

National Broadcasting Co., Chicago—On Wednesdays each week during the Farm and Home Hour, from 12:30 to 1:00 P. M., a news item of interest to all agriculture, but which particularly concerns New York State agriculture, and which is prepared by the Editorial Staff of A. A., is broadcast.

WHAM—On Mondays, Wednesdays, and Fridays, Western New York news items prepared by Walter Hoose, Assistant Editor, are broadcast.

On Mondays and Saturdays an editorial is given, prepared by E. R. Eastman.

On Wednesdays a talk of particular interest to farm housewives is given by Aunt Janet of A. A.

County Fair Monies Distributed

THE New York State Department of Agriculture and Markets has announced that town and county agricultural associations paid out \$432,850 in premiums at fairs held in 1930. The state has appropriated \$375,000 to reimburse the societies for premiums paid in the promotion of agriculture and domestic arts. The amount received by each association is dependent upon the premiums paid, the state paying fifty

per cent until a maximum allowance of \$6000 has been reached. The town and county fairs of the state are an important factor in the promotion of agricultural education and in the improvement of live stock and plant breeding.

Canandaigua Fair to Continue

AT a meeting of the directors of the Ontario County Agriculture Association, last week, a majority voted against the sale of the fair grounds to the city of Rochester. There has been considerable feeling on both sides of the question, some directors being in favor of selling the Association and paying up the large deficit that has been accumulated by the Association in the past few years, others feeling that there is a need for some such organization and that some sort of fair should be held in Canandaigua for the benefit of agriculture of Ontario County. Probably the matter is not yet settled but for the time being at least, the proposed sale of the grounds is blocked.

A New Scholarship Available

AN endowment to be known as the Hervey S. Hall scholarship has been recently announced by Cornell University. This scholarship, a gift of Miss Mary F. Hall, is open to properly qualified students in agriculture or forestry, preferably from the town of Spencer, New York, who are in need of financial aid. If no candidates are available from Spencer, the award will be given to a worthy student from Tioga County, or from the state at large. It is too bad that worthy students often can not finish their college course due to lack of financial support and such gifts as that of Miss Hall should be truly appreciated.

Dairy Has High Record

THE Dinsmore Estate at Staatsburg, New York, has the honor of having the second high herd in the Holstein-Friesian Association of America. The Estate has nine cows averaging 12,017 pounds of milk and 426.7 pounds of fat. This is certainly a mark for the average dairyman to shoot at.

Future Farmers of Arcadia Tell of Activities

THE Future Farmers of Arcadia held a business meeting last September and elected the following officers: Donald Greule-President, Hector Walter—Vice-President, Roy Lyon-Secretary, Howard Cambier-Treasurer, and Prof. L. F. Lee-Advisor.

The next big event of the Future Farmers was the second annual banquet at the Grange Hall on Wednesday evening, March 18, 1931. There were

over 100 people present. The groups joining with the Future Farmers included the Junior Project workers, Short Course members, Rural School teachers and the parents of the boys. A fine dinner was served by the ladies of the Newark Grange.

The program included an account of the New York City Marketing trip by Donald Greule. George Farrell, President of the 4-H Club, gave a talk on Junior Project work. F. Neff Stroup, Sup't. of Schools, told of his impression of European agriculture and compared it with the way farmers of the United States do their work. A. K. Getman, Chief of the Vocational Agriculture Division of the State Dep't. of Education gave an address on "The Cost of Leadership."

Following the program, Cornell's orchestra furnished music for dancing. The crowd seemed to favor the square dance. These were called by H. M. Hughes and Lloyd Ridley.

On March 26th some of the members of the Future Farmers went to Rochester and saw the selling conditions on the Public Market and afterwards took a trip through the "Arpeako" Packing plant. These trips seemed to be very interesting and successful from the educational standpoint.—Roy Lyon, Sec'y. Future Farmers of Arcadia.

A Queer Partnership in Yellowstone Park

STRANGE animal partnerships often have been noted in Yellowstone National Park, but probably the most remarkable of all, according to ranger-naturalists, is that of the badger and coyote, frequently seen trailing together.

The advantage of this "friendship" to the coyote, is easily recognized, Northern Pacific guides declare, but what benefit the badger can possibly hope to derive, isn't clear, because the coyote never has been noted for his generosity along any line. In fact, the badger is used by the coyote as a "tool."

However, these two animals often are seen together and the coyote often uses a badger den in which to raise its young. The badger is noted as a good digger and makes a warm home. Observers declare it is nearly impossible to pull or drown a badger out of his den because of the animal's strength and cunning. Using its body as a dam by expanding itself, a badger can stave off indefinitely, attempts to drown it out of its home and likewise, makes it difficult to pull it out.

The badger and coyote often go catching gophers together, but invariably, the coyote gets the better of the deal. The badger always a good digger, chases its quarry into the ground, rapidly digging after it. Soon the gopher, seeing it is cornered, leaves its home by an exit, where the coyote always is in wait. The result is that, the badger does all the work and the coyote gets the "bacon," and despite frequent clashes, the alliance continues.

From August 1-10, American Agri-

culturist will conduct a farmers tour to Yellowstone Park. Full details will be sent any reader without obligation.

Progress of TB Eradication in Pennsylvania

THE latest information from the Bureau of Animal Industry, Pennsylvania Department of Agriculture, on the progress of the bovine tuberculosis work, indicates that 38 counties are modified accredited, meaning that the disease has been reduced to less than one-half of one per cent. These counties are:

Beaver, Bedford, Blair, Bradford, Butler, Carbon, Cambria, Cameron, Centre, Clarion, Clearfield, Clinton, Columbia, Crawford, Elk, Erie, Fayette, Forest, Fulton, Huntingdon, Indiana, Jefferson, Juniata, Lawrence, Luzerne, McKean, Mercer, Mifflin, Monroe, Potter, Sullivan, Susquehanna, Tioga, Union, Venango, Warren, Wayne and Wyoming.

Five additional counties have been completely tested, but as yet are not modified accredited. These counties are: Allegheny, Lycoming, Somerset, Washington and Westmoreland.

The situation in the remaining counties is as follows:

County	Townships tested	Townships signed up	Townships not signed up	Total
Adams	0	1	20	21
Armstrong	23	0	5	28
Berks	3	7	34	44
Bucks	4	1	25	30
Chester	12	0	45	47
Cumberland	5	2	13	20
Dauphin	5	0	18	23
Delaware	0	0	21	21
Franklin	14	0	1	15
Greene	2	3	13	18
Lackawanna	3	2	14	19
Lancaster	6	0	35	41
Lebanon	0	0	19	19
Lehigh	0	0	15	15
Montgomery	6	0	31	37
Montour	6	0	3	9
Northampton	0	1	16	17
Northumberland	14	0	10	24
Perry	8	0	13	21

Schuylkill	8	3	26	37
Snyder	14	1	0	15
York	9	4	22	35
Total	145	25	407	577

Storrs Laying Contest

FOR the month of March the birds in the Storrs contest came through with 3,359 eggs more than for February, albeit 78 less than they laid in March last year. Thus, the total accrual for the fifth month was 21,448 eggs, or a yield of 69.2 per cent.

During this period Leghorns laid at the highest rate and they were followed in order by Australorps and Giants, Rhode Island Reds, Barred Rocks, White Rocks, and lastly by White Wyandottes. None of the breeds have been quitters, as evidenced by the fact that throughout the first five months average production for all varieties has run to nearly 63 per cent.

Readers will recall that the first 3,000 eggs laid when the contest started last November were reported as being 14 per cent under standard size. These 3,000 eggs that should have weighed two ounces each tipped the scales instead at right around 5,200 ounces. At that time the housewife, who paid top price for these eggs, took a licking because she got the equivalent of only about ten and one-half standard sized eggs.

During the intervening five months, however, things have happened. These contest pullets have not only jumped their yield from 3,000 eggs per week to 5,000, but they have also stepped up size from 14 per cent below to one per cent above the accepted standard of two ounces per egg. Thus, the average increase in egg size from these 1,000 pullets, considering all breeds and varieties in the contest, has been precisely three per cent per month. The buyer now gets more than his money's worth.—STORRS, CONN., April 6, 1931.

Under Frozen Stars

(Continued from Page 20)

told me about the factor at Sunset House. You came from God's Lake, didn't you? Well, it seems you left a very dark and mysterious past up there, Mr. Stuart, according to Paul."

"Oh, very! I'm really a terrible man, Miss LeBlond. Hadn't we better have Sarah in here as chaperone?"

She laughed as she shook her head. "From what I've seen of Sarah, I'd wager she's on guard now, waiting to rescue you from the woman with the gibodiegwasons. No, Paul Paradis didn't impress me. He made you too black. Father is quite different. He intends to beat you but he's sorry for you—sent here by your people on a forlorn hope. He says you're too good a man to sacrifice up here."

Stuart's features hardened. Forlorn hope, was it? LeBlond was a bit previous.

"This Paradis—did he tell you anything of his own past?"

"Oh, trust Paul for that! Most romantic and mysterious—if one were to believe him. Why, what do you know about him?"

An enigmatic smile was Stuart's reply.

"You do know something, eh? Well, I'm sure father does, too; but the man is a wonder with the Indians. That excuses a lot."

"When did you leave Winnipeg?" Stuart changed the subject.

"In June. It took me three weeks to get here, but it was wonderful—that trip."

"You like it—the wilderness?"

"I love it. You may think it strange for such a frivolous person to enjoy it up here, but I do. Of course I'd tire of it after a while."

"You go back in the autumn?"

Lifting her chin she slowly exhaled a cloud of smoke, her half-shut eyes on the spruce poles of the ceiling; tilted head baring the round throat in its loose flannel collar caught by its scarf of crimson silk. Wonderingly the man studied her so manifestly at ease in the house of a stranger, her father's rival for the trade of the district.

"Yes," she answered, after a space, "my father seems bound to marry me off in Winnipeg, you know. And Paradis

worries him, with his mooning around ever since I came. Imagine," she laughed, "that monkey, Paul Paradis!"

"He's quite beautiful," objected Stuart. "I met him at Medicine Stone Lake, last November. His little moustache, and his red sash and embroidered leggings, surely ought to impress the ladies."

Two Different Stories

Without turning her tilted head, she flashed at him a sidelong look from under her long lashes. "He seems to hate you; what have you done to him?"

"Nothing, absolutely nothing," protested Stuart, "except to knock him down when he tried to hog the trail."

The girl straightened in her chair, her vivid face alight with interest. "What? You dared do that—to the great Paul Paradis?" she demanded.

"There was no trouble," drawled Stuart. "It was nothing. He stayed down."

"Ah! That explains a great deal. I knew there was something besides trade rivalry between you."

"What did he tell you, Miss Aureole?"

"He told me you had had trouble on a trail—that he had been compelled to choke you."

(Continued Next Week)

Answers to Puzzling Problems

1. 320 pounds. Explanation—Subtract 10 from 40; subtract 10 from 30; divide 160 by 20; multiply 8 by 40.

2. \$350. Explanation—Multiply 1500 by .05; multiply 500 by .45; subtract 225 from 500; add 275 and 75.

3. 7 yards; 12 yards. Explanation—Divide 76 by 4; square 19; subtract 193 from 361; subtract 168 from 193; extract square root of 25; subtract 5 from 19; divide 14 by 2; subtract 7 from 19.

4. 1050. Explanation—As the percentage of reduction is the same in both cases, the numbers must be equal.

5. Joe \$4; Fred \$8; John \$24. Explanation—Using Joe's money as a unit, Fred and Joe have 3 times as much as Joe alone. John has 6 times as much as Joe. Subtract 3 from 6; divide 12 by 3; multiply 4 by 2; multiply 8 by 3.

6. 6 inches. Explanation—Cube 3; cube 4; cube 5; add 27, 64, and 125, extract the cube root of 216.

HANDY ANDY Says "Here's How"

To Polish Rusted Plow Shares

By Ray Inman

IN SANDY OR GRITTY SOIL:
Simply rub off worst of rust with piece of brick or sandstone and let the soil do the rest.

IN SILT LOAM, WAXY, OR GUMBO SOIL:
Grind off rust on emery wheel, then polish surface carefully, moving in direction soil moves.

IN EXTREME CASES:
You may have to put on a high polish with fine whiting or prepared chalk....

Country "Rackets"

THE city papers tell us of rackets and racketeers and sometimes we think that they are confined to the city. This is not true and we are warning readers of two "rackets" that are costing farm people thousands of dollars every year and which are likely to be particularly active for the next few months.

First are a number of concerns that we collectively speak of as "auto service associations." The idea started as a sale of memberships to motorists who were supposed to get benefits in the way of reductions on gasoline, oil and motor supplies, free towing service in case of accidents, and in some cases a very limited amount of legal advice. When the financial responsibility law was passed in New York State some of the agents saw a fine opportunity to cash in. While these agents may not actually say so in so many words and certainly never write it down in black and white, thousands of our subscribers have believed that agents of these concerns are selling auto liability insurance which protects the buyer in case he damages a car or other property in an accident.

We, of course, have no reason for objecting if our subscribers want to join one of these auto service associations if they realize exactly what they are getting and think it is worth the cost. Hundreds of letters from sub-

scribers who have joined indicate that they feel they have not received benefits in proportion to what it cost them.

We believe in automobile liability insurance, but suggest that you take it from a well known insurance company, that you read anything you sign or pay for very carefully and know exactly what you are getting. In addition to the money which subscribers pay for these memberships, there is a false sense of security if they think they are insured. Should one of them be unfortunate enough to have an accident he then learns that his car has never been protected by liability insurance.

Another source of loss to rural people are the associations of tourists homes. The tourist home business has had a remarkable growth during the past few years and many farmers pick up a few extra dollars in this way. The idea back of the tourist home association, is that it serves as a guarantee of quality to the tourist. This sounds good and apparently a few associations have followed the idea rather closely. Dozens of others do nothing except to collect their money and in some cases deliver a sign and a few road maps. In fact, we have even known of cases where subscribers have received absolutely nothing for the money they have paid.

We have a feeling at present that there are so many tourist homes and

so many association signs that they have come to mean nothing to the tourist. We feel that the best possible advertisements for over-night tourist homes are attractive surroundings and a neat home-made sign which can be easily seen from a considerable distance away. Certainly, every subscriber who is approached by an agent of such a concern should determine whether or not the person or concern backing it is responsible, whether they restrict their membership to one person in each community, whether there is any membership at all, or whether the only requisite for admission is the membership price, and last but not least, should consider carefully whether the money spent is likely to be returned by added trade.

Contest Winners Get Prizes

IN our March 14 issue, under the heading "So Near and Yet So Far" we printed a subscriber's letter complaining because he did not win a prize from the Hollywood Marvel Products Company. We followed this with a quotation from the National Better Business Bureau about easy puzzle schemes. It appears that the warning from the Better Business Bureau printed by us, referred not to the type of contest conducted by this company, but rather to puzzle contests put out by a number of publications for the purpose of getting agents to take subscriptions for magazines of rather questionable type.

We understand that this company does conduct the contests in accordance with the rules which they publish and that the prizes are given to the winners.

New England Commission Company Closes Doors

IN the March 14 issue, we mentioned that we had been receiving complaints against the New England Commission Company. We have just been informed that this concern quit business, that the store is empty, and the door locked.

Mr. Joseph C. Berman was connected in some way with the New England Commission Company. We understand that he maintained that he was merely working for them, although there was some suspicion that he was really back of the company. However that may be we have pointed out in American Agriculturist that the concern was not a commission company and was not licensed and bonded.

Many readers will remember that Joseph C. Berman, Inc. failed in business about a year and a half ago and that the bond taken out with the State Department of Agriculture and Markets failed to cover consignments from producers.

We Are Working On This Case

BACK in December 1929, a subscriber asked our help in getting a refund of \$40. which he had paid to the Keith Publishing House, Asbury Park, New Jersey, for which they were to make a song into a player piano roll. This \$40. had been paid to the Keith Publishing House about two years before our subscriber first wrote us.

We wrote several letters to this company. Finally, on April 23, we had a reply from them, part of which states: "This matter has been delayed on account of illness of Mr. Keith, but is now having proper attention. Mr. is entitled to a certain refund and will receive the same soon as possible."

On being advised at intervals by our subscriber that he had not received a reply from them, we continued to get in touch with the company. They wrote us again July 10, 1930, containing the statement: "I beg to state that the claim will be adjusted as soon as possible. We have no intention of delaying the matter any longer than we can possibly help."

We received another letter dated December 16, 1930, which contains the following statement: "I shall use every

effort to settle this during January or February 1931 and assure you that Mr. will not be neglected in the matter."

Another letter dated February 11 from the Keith Music Service says: "There is no question of the justness of the claim and we would readily remit the amount at once if we were

One of Many Fine Services

I RECEIVED your kind letter also the draft for one hundred and thirty dollars (\$130.00). This will certainly help defray some of the expense caused by my accident.

I have not fully recovered and probably never will but am so much better than I expected to be that I have much to be thankful for.

I certainly think this insurance protection rendered by the American Agriculturist is great. One surely ought not to be without it. For the sum of one dollar my returns have been great. It certainly was the wisest thing I ever did when I invested the dollar in this insurance. This is just one of the many fine things the American Agriculturist does for its subscribers.

Sincerely yours,
Fred L. Place.
Oswego, N. Y.

Mr. Place was injured when an automobile skidded Sept. 29th, 1930, causing a fractured skull.

able." A letter from our subscriber dated February 24, informs us that up to date he has not received this money. We believe that it is only fair that we should publish the history of this case for the information of our subscribers.

Danger at Boulder Dam

Can you give us some information about possible work at Boulder Dam which we understand is to be started soon? We are planning to go there in an attempt to get work.

THE Federal Government has definitely advised against going to Boulder Dam in the hope of getting any work. As we understand it, the site of the dam is at present in a section that is very sparsely populated and there is grave danger that a lot of people will go there in the hope of getting work and become stranded there.

It is our understanding that work has not yet begun, that when it is started it will be in the hands of private contractors who will, of course, hire their own men. Our advice is that no one should go there unless you have a job before you start. There is almost certainly going to be plenty of men who will be willing to take the chance only to be disappointed. Under the unemployment situation it is easy to see how thousands of men will descend on the place without any chance at all of getting work.

\$10,000 PROTECTION AGAINST ACCIDENT and SICKNESS
For Only **\$10. year** No Dues or Assessments
Men, Women, 16 to 70 Accepted
NO MEDICAL EXAMINATION
Policy Pays

RAISE

GOOD SILAGE

IT WILL PROVIDE

>>>>>>>>> **1/3** <<<<<<<<<<

THE DIGESTIBLE FEED YOUR COWS NEED

GOOD CORN SILAGE is produced by the variety of corn which makes fullest use of the growing season — reaching heavy growth and maturing neither too early nor too late. This requires seed of high, vigorous germination, which is bred, selected, and adapted to the job.

- For most New York Milk Shed growing conditions, G. L. F. Genuine West Branch Sweepstakes fills this requirement. Bred by your G. L. F. Seed Service from selections made by plant breeding specialists of Cornell, the 1931 supply of G. L. F. Sweepstakes corn is germinating as high as 99% quick, strong sprouts. In the few short months between planting time and the first frost in the fall, this variety produces silage containing a maximum of dry matter, a maximum of *digestible* feed per acre. Sow this seed only. It will provide *all* the succulence and one-third of the *digestible* feed needed for milk production next winter.

- For the higher altitudes with their shorter growing seasons, G. L. F. Early Golden Glow, G. L. F. Cornell #11, and G. L. F. White Cap Yellow Dent may possibly be preferred by some G. L. F. Patrons. These, and enough other old-time favorite varieties, are available from G. L. F. Agent Buyers to suit every individual preference and price.

(Above) G. L. F. Genuine West Branch Sweepstakes corn on the farm of Aungier Bros., Tully, N. Y. Planted May 24, 1930 at the rate of 10 qts. per acre. Photo taken September 16, 1930.

(Below) This 1930 crop G. L. F. Genuine West Branch Sweepstakes corn was not cut for silage and produced 127 bushels of well matured ear corn per acre for J. Kingsley Crane, Howells, N. Y., Orange Co.

A cow needs 21 lbs. of *digestible* feed each day to produce 40 lbs. of milk. One third can be economically supplied by good silage. Almost another third (from 5 to 6 lbs.) can be supplied by GOOD LEGUME HAY. Fields sown with G. L. F. Selected Origin Alfalfa Seed have repeatedly shown their ability to out-yield and out-live all others. The G. L. F. selects for you only seed which has high yield inheritance and which is adapted to our region. When you sow this spring, why not use G. L. F. Selected Origin Grimm or Ontario Variegated Alfalfa Seed?

SHRINES OF AMERICA

Barbara Fritchie's House

September, 1862, and a vicious Civil War is tearing down what seven years of Revolutionary War set up. Clouds of despair hang heavy over the Union as victorious Confederate troops, marching north, enter Frederick, Maryland. From a little window of a house on the outskirts flaps a Union flag. Confederate rifles crack, the flag drops and is snatched up by a little gray-haired woman who appears suddenly at the window. She waves it in the face of passing columns under Stonewall Jackson. Rifles, again raised, are lowered by Jackson's staying hand and command, "March On!" Confederate troops passed all day under Barbara Fritchie's Union flag, and she became a symbol of the courageous loyalty which carried the Union through its most desperate fight for life.

SEEDS, BULBS, PLANTS Priced to Save You Money

Springtime is planting time. But there is no need to pay more for your seeds, or bulbs, or plants, or trees than we ask—and no opportunity to buy them for less. World leadership demands leadership in quality as well as price. We guarantee the quality. We guarantee to save you money.

As with Nursery Goods, so is it with all other merchandise. This new catalog offers 48,000 articles—all priced at new low levels—all guaranteed to give complete satisfaction.

If you consider value when you buy, you should use your Sears catalog. Every page presents an opportunity for economy, unmatched elsewhere. Every purchase you make will bring a saving. And every article we sell is backed by the strongest guarantee the World's Largest Store knows how to write—complete satisfaction or your money back.

If you haven't a copy of this great book, borrow one from your neighbor.

Some Reader Editorials

Where Selling Direct to Consumer Pays

IN the January 10 issue of your most valuable paper, I read with interest the article "Buying Potatoes—A Consumer's Experience." We have never sold potatoes just that way but for eight years in a neighboring city we have satisfactorily peddled and filled orders not only for our entire crop of potatoes but for all other surplus produce which a diversified farmer has to sell. Each year our regular customers ask us to supply their friends which we gladly do as long as we have enough to go around. We charge a few cents more than the retail price in the stores and deliver first class produce only. We give full weight and good measure and our butter, cottage cheese, eggs, sweet corn, dressed pork or fowls are strictly fresh when delivered. We believe this to be the main reason for our success as in the eight years we have never had a complaint. We never buy from others but let what we raise go as far as it will. The extra that we get in price on each load just about pays the delivery charges, making our real profit just about what the middleman would get.

Observation has taught us that the city house wife has just cause for being dissatisfied with some of the stuff she buys from unscrupulous peddlers whose only aim is to get rid of his load, never expecting to return to that vicinity. We have never yet found a single instance where the city consumer was unwilling to pay a good price if he received good quality and a square deal.

Money Not the Only Return

We have seen city life in its various phases and have had the opportunity of knowing how the other half lives. Each fall brings surprises. We find homes filled with joy by the advent of a new babe or unexpected prosperity. In others we find the shadow of grief and worry caused by lack of work, or death has taken its toll leaving an aged widow or grief-stricken parents in its wake. Again we find a home invaded by illness and the victim a helpless cripple. We share their joys and sorrows alike, giving assistance and sympathy when possible.

While we never expect to become "multi's" by this method of marketing, we are already rich in experience and we surely get all the profit to be had from the fruits of our hard labor, besides having made many pleasant acquaintances and staunch friends.—S. E. L. R.

This Makes Our Mouths Water!

I WAS much interested in your advocating the use of more milk at home, and would like to give my experience.

The best way to save milk to skim or separate for butter is to take out the full amount, say, one can, for a churning. This usually can be done, except where the milk is sold on a route. It saves the charge for hauling a can; it is the same age and makes better butter than cream saved from day to day, and in the case of separating, it saves washing the separator more than once. A pint or more of this cream plus six eggs made into a custard with two quarts of milk, three cups of sugar, two tablespoons of vanilla make an ice cream that city people can only dream about, enough of it, too, so there are second dishes and some for the friends who call.

About this poor butter! Shop around. Find the grocer who sells the most, holds it the shortest time, takes the best care of it, and you will find good butter. There is little salt in creamery butter and the careless grocer lets it get tainted or stale. Do not change to oleomargarine. Tell him about it. Kick and keep on kicking till he gives you good sweet butter. It helps the dairy industry to have people insist on good butter rather than stop using butter. Can anyone say they like oleomargarine on baked potatoes, corn on the

cob, brown bread or hot biscuits? I do not; I like plenty of fresh butter, a little salty, made by one who counted not the time or effort but thought it well worth while if the result were perfect—texture, odor and color. Nothing is better than a roll of such butter with perhaps five marks of the label across the top as the final touch of a loving hand. Ah! That is real food—not just stuffing for an empty stomach—but something for the eye to linger on, the tongue to savor and the heart to be thankful for.—B. H.

A Ray of Sunshine

I HAVE taken the American Agriculturist for some years but never knew the value of the paper until the last two weeks. I got my foot hurt, two bones broken in my foot, so I could not get around. I was working in the ice house of Borden's. I now read every word that is in the A. A. It comes like a ray of sunshine. It brings cheer and comfort to those that are shut in more than you can ever know.

The paper is useful and helpful. I have bought some things that were advertised in the paper and found them as advertised. This is the first time I have ever written to you. I hope this will not tire you too much to read it.

I will close wishing you luck and thanking you for the little paper.—J. B. S., N. Y.

A Ghost Story

MR. VAN WAGENEN'S article in a recent issue, "Dead Men's Hands" reminds me of some of my early childhood days spent on my grandfather's farm. There was the large old-fashioned house which would be very inconvenient now but a fine house in old days. The horse barn joined the house at the end of the long wood shed. Grandfather was a great horse lover and the big barn was filled with stalls and stables. To the East and quite a distance from the house, stood the upper barns which consisted of the cow barn, a big hay barn, and a long sheep shed joined the two barns.

Like a good many places in the old times, those upper barns held a ghost story. I am not a believer in ghosts, but I've seen the cause of the story a great many times and wish I could solve the mystery. I remember one night in particular (I must have been about seven years old, but I have an unusual memory for I can recall in clear pictures back to when I was three years old) my father was late with his chores and I stood in the old meal room off the kitchen watching a light at the upper barns which traveled back and forth between the two barns. I had watched it for some time when the kitchen door opened and my father came in but the light was still there. I questioned him only to find that he had been at the lower barn all the time. Then he told how neighbors and even himself had followed that light only to have it go out when they got real close. From the distance it looked exactly like a lantern and traveled like a man hurrying his chores. Back and forth it would bob between the two barns and then to the south in a neighbor's field where it would go out. It would bob as high as a man's head then disappear.

This seems a strange story, but my father and old neighbors will vouch for it. I have heard it explained since as pockets of electricity that showed only at night. It surely was strange; made one feel creepy. The ghost story is that greatgrandfather, an early settler and owner of several farms, was thought to have had considerable money beside and had buried it just before his death. He was trying to tell some one where it was buried. Well that was twenty-five years ago and no one has found it yet. It has been some time since I visited the old farm so I do not know if the light is still visible or not.—MRS. R. E. GREEN, Basom, New York.

Make the Surplus Milk Into Butter

How to Churn Easily and get a good Product

EDITOR'S NOTE: Because prices for farm products are relatively low when compared to prices for things that must be bought, more than the usual amount of attention is being given to consuming more farm products on the farm.

On this page we are giving detailed directions for making good butter. These facts were given some time ago in a talk by Professor E. S. Guthrie of the New York State College of Agriculture, over radio station WEAI.

INASMUCH as we receive many letters concerning difficult churning, I think that we should first talk about the churning quality of cream. The following factors important in churning are:

Temperature—Temperature is the most important factor influencing the churning process. The fat globules should be sufficiently warm to cohere, but, on the other hand, the temperature should not be so high as to cause greasy butter, increased loss of fat in the buttermilk, or the incorporation of too much buttermilk. In the hand churn, with well-ripened cream testing 30 to 40 per cent fat, the temperature should be 56 degrees to 62 degrees F. After the ripening process, and several hours before the cream is placed in the churn, the temperature should be lowered to the proper degree for churning. The reason for this care in cooling the cream is that it requires some time for the fat to recrystallize, or harden. When cooling, natural ice should not be put in the cream, for it may contain harmful microorganisms and, it may dilute the cream so that churning may be difficult.

The buttermaker must regulate the temperature, the richness of the cream, and all other factors, if he wishes the butter to be firm and waxy instead of being poor in texture and greasy. He must remember that the proper churning temperature is that at which the churning process will require 30 to 45 minutes when all of the other factors are normal.

Richness of cream—It is easy to understand that rich cream, in which there is a comparatively small amount of skim milk, will churn more readily than cream containing a greater amount of skim milk. The greater the amount of skim milk in the cream the more difficult it is for the fat

globules to come together. For easy churning, the cream should contain 30 to 40 per cent of fat. Thin cream, such as when it is skimmed by hand from the milk in a pan or a jar, is often the cause of difficult churning. Sometimes it is necessary to churn cream with a low percentage of fat, but this is done at the expense of time or of the quality of the butter, and often of both. If the cream is too rich in fat, it will adhere to the sides of the churn.

Ripeness of cream—Ripe, or sour, cream is less viscous than sweet cream, and it therefore churns more easily.

Condition of fat—The kind of feed given the cows has a marked effect on the condition of the fat. In winter, when the cows are on dry feed, usually the fat is harder than in summer. The condition of the fat is also affected by the breed of the cow, her individuality, the stage of her lactation period, and perhaps a few other factors. Hard fat requires a few degrees higher temperature in churning than soft fat requires. I recall very vividly the description of the experience of a New York creameryman who had made butter in Georgia. He said that in order that his churn should not run all day, he soon found that it was necessary for him to have the cream at 70 degrees F. or above, instead of employing the usual temperature of 52 degrees to 60 degrees. The cottonseed meal that the cows ate was responsible for the hard fat, and for the lack of cohesion at the lower temperatures.

Size of butterfat globules—The size
(Continued on Page 8)

Butter making on the farm is not the hard task that it once was. The electric current will run the separator and churn for a few cents an hour.

Some Questions About Applying Fertilizers

The Right Use of Plant Foods Lowers Production Costs Per Unit

By H. L. COSLINE,

Associate Editor, American Agriculturist

WITH prices for farm products as they are likely to be next fall, it is more than ever important that users of commercial fertilizer should get the best possible results from it. With this idea in mind, we are giving some of the questions which have come up in the minds of our readers, together with the answers.

* * *

Do you advise putting fertilizer in the hill or row, or broadcasting it before the crop is put in?

In general put commercial fertilizer in the row where land lacks fertility, where the amount of fertilizer applied is small, and where the fertilizer is relatively high in its content of phosphorus and relatively low in nitrogen and potash. Broadcasting on cultivated crops is more commonly used where a very heavy application of fertilizer is made. Under these conditions a part is sometimes broadcast, and the remainder put in the row when the crop is planted.

* * *

How much danger is there of injuring the germination of seed where fertilizer is put in the row?

There is little danger so long as the total ap-

plication per acre is light or where a fertilizer contains relatively high amounts of phosphorus. The damage to seed depends on the solubility of the fertilizer. Readily available nitrogen or potash compounds are practically 100 per cent soluble and may injure seeds where applied too heavily, in contact with the seeds. Damage is likely to be worse on sandy soil. It is well to remember that few users of fertilizer make applications heavy enough so that they need to worry about damage to seed. There have also been developments in planting machinery designed to make fairly heavy applications of fertilizer without allowing it to come in contact with the seed.

* * *

Does applying fertilizer in the hill or row tend to restrict root growth; that is, do the roots develop only until they reach the fertilizer and then stop growth?

No. This theory was once advanced as a reason for broadcasting rather than putting fertilizer in the rows. It has been shown that roots usually branch out more abundantly at points where they come in contact with fertilizers, particularly with

Broadcasting fertilizer by hand on a hillside pasture. It would seem that a lime sower or broadcast fertilizer distributor would do the work with less labor.

phosphorus. Some authorities recommend putting a part of the fertilizer fairly deep in the soil so that a well developed system of roots will be located below the depth to which the soil may dry out during periods of low rainfall.

* * *

What kinds of seed are most easily injured by direct contact with fertilizer?

Potatoes are one common crop where the fertilizer in direct contact does some injury. Legumes which grow fairly large seeds are also injured; for example, field peas, cow peas, and soy beans. Corn is less subject to injury than some other crops. There is little danger of injury to small grains with the size of the application
(Continued on Page 20)

One of the newer corn planters designed to put fertilizer in strips parallel to the row but not in contact with the seed.

Grange Name Wrongly Used

"A short time ago my attention was called to a dairy feed company in Syracuse, New York, which is putting out dairy feed under the name of the National Grange Dairy Feed Company. I question whether this company has a right to use the name 'Grange' in any sense unless authorized by the State or National Grange as the State and National Grange and many subordinate granges are incorporated.

"There is no connection whatever between any of these granges and this feed company . . . Farmers should be warned against the purchase of this feed."—Signed, F. J. RILEY, *Secretary, New York State Grange.*

ON receipt of this letter we wrote to L. J. Taber, Master of the National Grange, and received the following letter in reply:

"Dear Mr. Eastman:

"I have your favor in which you state that one or two companies in New York are making feed in the name of the National Grange Dairy Feed Company, and similar names. Grange Law provides that no company can use the word 'Grange' or 'National Grange' unless their company has been endorsed by the National Grange or the Executive Committee of the National Grange. The companies in question are grossly deceiving the public, as they are using the Grange name in violation of Grange Law and common decency in business and ethics.

"I have just written to the National Grange Dairy Feed Company at Syracuse, New York, calling their attention to the deception and their violation of Grange Law and Practice, and demanding an explanation."—Signed, L. J. TABER, *Master, National Grange.*

It is hard to understand why a reputable business concern would wish to work under a misleading name, as this dairy feed company seems to be doing. Just from a plain, common sense business standpoint, one would think that the company would realize that a wrong use of the name of the Grange organization would create resentment on the part of thousands of Grange members that would make sales resistance extremely difficult. No individual or business that does not stand clearly on its own feet can hope to succeed over any long period of time.

Do Not Reduce Fertilizer Applications

FERTILIZERS are not high priced. The National Fertilizer Association states that in 1930 the fertilizer industry earned only about 3.8 per cent on its net investments. In 1929 its earnings were about 4 per cent. In 1927 the industry lost about \$20,000,000. In comparison, the motor industry earned 23.5 per cent on its net

worth, the petroleum industry earned 11.1 per cent, and other business made similar profits.

Because of the hard times and the reasonable prices for fertilizers, farmers should buy and apply reasonable amounts this year, not to increase the grand total of production but to keep the individual farmer's costs of production down. The right use of fertilizers will help to do this.

Farmers are using fertilizers as well as dairy feeds far more intelligently and judiciously than they did even ten years ago. Every soil and every crop has its particular needs. The subject is important enough to make it well worth your while to study farm papers, college bulletins and discuss the matter with your own county agricultural agent.

The Cause of Hard Times

FROM December, 1929, to December, 1930, the price of wheat decreased 40 per cent, the price of flour decreased 30 per cent, and the price of bread, one per cent.

There, in one sentence, you have the factor that causes more of the hard times in America than all of the other causes put together—distribution. In the midst of plenty, thousands are hungry and millions more go without necessities. Our whole distribution system has failed to keep pace with production, whether it be production on the farm or in the factory.

\$5,000 or \$50,000 Roads—Which?

"It is time to stop building \$50,000 roads and begin to build more \$5,000 per mile roads."

THOUSANDS of farmers all over the land will agree with this statement, made in the AMERICAN AGRICULTURIST office the other day by a prominent New York State farmer. This man went on to describe a new piece of highway construction over which both of us have driven all of our lives.

"Here is a road," said our friend, "over which there is not much traffic. There is not even a village on its entire length, and the farms are poor and scattered. A good narrow gravel road built for \$5,000 a mile or even less was all that was needed and would have given better service than over half of the farmers in New York State living on dirt roads now have. Yet, because of local political pressure, a road costing around \$50,000 per mile was finally built. The dirt road farmers of the State or of the nation are not going to be lifted out of the mud very fast at this rate."

We fully agree. The great main highways have to be well constructed to stand the traffic. Probably they are worth all that they cost. The State certainly is doing an infinitely better job of road building than has even been done before. But these main arteries of travel are now mostly constructed. Most of those that are left are of the farm-to-market kind of road where traffic is not so heavy, and on this type of highway it is certainly better to have ten miles of fair gravel roads than one mile of wide, well-built concrete and nine miles of mud.

With all of the millions that have been spent on road building, up to the present only eighteen per cent are hard-surfaced. H. J. Kirk, Director, Ohio State Department of Highways, well asks the question, "How are we going to improve the other eighty-two per cent, the remaining two and a half million miles? We have been at this job of road improvement for the last twenty years and we are giving good service on only eighteen per cent of our mileage. We have spent ten billions of dollars on the eighteen per cent.

"Mud-bound communities must be released from their bondage and it must be done on seventy-five per cent of our mileage for only a few thousand dollars per mile, or not at all. Funds are not available and never will be available to lay the so-called permanent pavements on the greater portion of our rural mileage."

How we wish we could get our farmer friends

aroused on this road problem. When public opinion is sufficiently aroused, it gets what it wants in spite of selfishness and politics. Why not appoint a road committee in every local Grange, Farm Bureau and League, and then coordinate these committees and their data into a general county committee? Such a committee could work out a county road program and map unselfishly and in the best interests of all the citizens of the whole county. Think it over.

Buying the Other Fellow's Culls

"I wonder if you would help us discourage the dairymen of the New York milk shed from buying western and Canadian cows. These cows are culls from their testing associations and are being sold here at high prices, and it is these low test cows that are ruining our market.

"I find in a survey that the average of plants has been falling off for the last two or three years. It has practically ruined the grade A market. I think there is much more danger in losing our market through low test milk than there ever was in short supply of fluid milk.

"We must do something to build back this market, and the only way we can do it is to make a better grade of milk. I do not mean that farmers should change their dairies around at once, for this is too expensive, but be careful in buying low test cows. They can save the fore milk or some other method to increase their butter fat test, but they must do something and do it now or it will not be a case of degrading plants but there will be no more grade A milk."—W. R. R.

THERE is nothing we can add to the above letter, except an "amen," especially to the statements in the first paragraph. We make several trips into the Central West during the year and we know these statements are correct—that is, that New York dairymen have in too many cases been buying cull cows from western cow testing associations.

Just look at this from your own standpoint. Suppose you have a few cows to sell. If you expect to stay in the dairy business, which ones will you sell, the good ones or the poor ones? You are even more likely to get rid of the poor ones, if you belong to a cow testing association and know absolutely which the poor ones are.

For years this publication has been saying that cattle prices were too high and that dairymen were so anxious to add to their herds that they failed to consider the quality of the individuals added. Some of our friends criticised our statements about too high prices, but as the above letter states it has been these poor cattle often purchased from outside this milk shed that has increased the surplus burden for everybody, and, worse still, has been a costly investment to the men who bought such stock. The only hope now is to let these poor cows go to the butcher, and the sooner, the better.

Eastman's Chestnut

A MISSIONARY priest in Auckland, New Zealand, was leaving the rectory of his church when an old lady approached him and asked him for something toward her rent. He told her he never carried any money, being dependent on the good will of his colleagues for his own needs, and that she should appeal to the parish fathers. But the old lady replied that she had received an inspiration while at prayer in the church that the first man she met would give her the rent, and she insisted that he search his pockets. So to satisfy her the missionary drew out his pockets. Great was his astonishment to discover a \$20 gold piece.

"There you are," she cried, "didn't the blessed angels tell me true?"

"Take it, my good woman," said the missionary, "and God's blessing with it—it's certainly a miracle."

At dinner later the missionary told the fathers of the incident. "Now wouldn't you call that a miracle?" he asked.

"Divil a miracle," groaned one old father at the end of the table. "You just had my pants on, by mistake."

How to Run a School Meeting

Answers to Questions That Every Voter Wants to Know

THE education law provides that the first Tuesday of May in each year shall be the time of the annual meeting and unless otherwise provided by a vote at a previous meeting, the meeting shall be called to order at 7:30 o'clock in the evening in the district school house. The meeting this year, therefore, will soon be here and there is always a good deal of question and doubt on the part of the voters and school officers as to how a meeting should be conducted. Unless it is conducted according to law its conclusions are not legal and there are possibilities for considerable trouble. Therefore, we have set forth in the following paragraphs some of the chief questions that arise in the conducting of a school meeting and in order to make it easy to understand, and readable, we have put the information in question and answer form.

* * *

May the meeting be held at any other time or place?

No. The annual meeting in common school districts must be held on the date fixed by law. If there is more than one schoolhouse the meeting shall be held in the one usually employed for that purpose unless the trustees designate another.

* * *

How and when must notice of the meeting be given?

It is the duty of the district clerk to post five notices of the annual meeting in at least five conspicuous places in the district at least five days previous to the date of the meeting. One such notice must be on the front door of the schoolhouse. If the office of district clerk is vacant the trustee must give such notice.

* * *

How is the meeting organized after the voters are gathered?

The trustee or some one calls the meeting to order. If no trustees are present, the clerk of the district should do so. If neither clerk nor trustee is present, any legal voter may call the meeting to order. Someone should nominate a qualified voter of the district to act as chairman and the person calling the meeting to order should put the motion. The district clerk should act as clerk of the meeting. If no clerk is present a temporary clerk should be elected. No written ballot is necessary for this purpose. A clerk must keep an accurate and complete record of all the proceedings including a record in full of all motions and resolutions and should note the vote upon each such motion or resolution.

* * *

How about reports of officers?

After the meeting is organized officers' reports are called for. The trustee is first. He must render his report in writing, containing a full and true account of all moneys received and the manner in which all moneys have been expended. The trustee's report must be a record of the drafts or orders made by him upon the supervisor, collector, or treasurer, and a full statement of all appeals, actions, suits and proceedings brought against the district or by it, and of each special meeting touching the conditions of the district. The report must cover the year beginning with the date of the preceding annual meeting. The trustee's report must be read and either accepted or rejected by the voters. At the discretion of the meeting it may be referred to a committee of qualified voters for examination. Such report should be filed with the district clerk and may be examined by any qualified voter at any reasonable time.

* * *

How about reports of other officers?

Similar detailed reports must be made by collectors of the district,

by the treasurer and by any special committee if there were any appointed. Not all districts have treasurers. The collector's report must show all collections, receipts and disbursements for the year covered since the last annual meeting.

* * *

What about reports of teachers' contracts?

The trustee should report to the meeting whether any contracts have

been made for the employment of a teacher or teachers for the next year, commencing August 1st. If such persons have been employed, their names, terms of service and compensation must be stated. It should be carefully noted, however, that where there is only one trustee he does not have the right by law in common school districts to contract for the teachers for the next school year before the annual school meeting.

* * *

How are estimates made of the amounts of money to be raised for taxes during the next school year?

This is an important question and it is one that should be clearly understood, as often disputes arise about the amount of money to be raised and how it should be raised. Here is the correct way:

The trustee or trustees of the district must render to the school meeting a statement of the amount of money necessary to be raised by tax during the ensuing year. The school year be-

gin, as you know, on August 1st. Here are some items for which taxes may be raised: payment of teachers' wages, for the district school library, for fuel and lights, for the service of janitor, for insurance of the schoolhouse, furniture, etc., for repairs, if any are necessary, to the schoolhouse or furniture, for fees to be paid to medical inspectors appointed by the trustee, for the installation, repair, and maintenance of toilets and for keeping same in sanitary con-

dition, and for some other purposes which are authorized by law. The trustee may get his financial statement ready for the meeting by taking note of the moneys spent for various purposes during the previous year, by noting the amount of State aid that was furnished, and by consulting the district superintendent of schools. If the school meeting fails or refuses to vote the necessary tax, the trustee may issue a tax list for such expenses which the law specifically authorizes the trustee to expend. Trustees may also and at any time make repairs to the schoolhouse without a vote of the district, but such repairs cannot cost more than \$50. The district superintendent of schools, however, may order repairs to be made without a vote of the district, in an amount not exceeding \$200.

It should be said that the new state aid rule, recently enacted in New York State makes it unnecessary to raise so much local money in school districts as has been necessary in past years. Under

this new law it is assumed that it takes \$1500 a year to run a good rural school. This is not always the case, for good schools are often run on much less than this. But of this \$1500, the local district may raise a tax on the true valuation equal to 4 mills and the State pays all of the rest of the \$1500.

Under the new law it is necessary for the district to furnish transportation to its pupils of high school age in the district under certain circumstances.

* * *

How must the voting be done in the matter of taxes?

By written ballot or by taking the ayes and noes of the qualified voters attending the meeting. This means that the clerk must set down the names of each person voting and write opposite each name "aye" or "no", according to the way the person votes.

* * *

May a trustee be paid for his services?

No. Such payment is illegal. American Agriculturist believes that trustees should have some small payment but the State holds that if all trustees were paid it would add greatly to the tax burden, and that there ought to be in every community men or women interested enough in the education of children to be willing to serve as trustee.

* * *

After the meeting has been organized, officers' reports been received, and approved, and estimated taxes for the next school year been provided for, what is the next step?

The election of district officers for the following year.

* * *

Is it all right to elect these officers by acclamation or orally?

No. Such election is illegal. All school district officers must be elected by ballot.

* * *

How is this done?

Two inspectors of election appointed by the meeting see that the ballots are properly deposited in the ballot box provided by the trustees. The clerk of the meeting must keep a poll list containing the name of every person whose vote shall be received. The law expressly requires that such a list should be kept. If any vote is challenged, the clerk must make note of this after the voter's name. The ballots may be written or printed, or partly written and partly printed. The meeting may vote for the candidates for all district offices on one ballot, or may vote for each officer separately.

* * *

Who is eligible for district school offices?

Every school district officer must be a resident of his district and qualified to vote at its school district meetings.

No person is eligible to any district office who cannot read and write. No person can hold more than one school district office at one and the same time.

* * *

After the ballots are deposited, what then?

The inspectors must then proceed to count the ballots without opening them. The total number in the ballot box must be compared with the number of votes on the poll list, and if the whole number of ballots is equal to or less than the number of names on the poll list, such inspectors shall proceed to count the ballots and announce the result to the chairman of the meeting. But, if there are more ballots than the names on the poll list, such inspectors shall place the ballots in the box and draw therefrom the number of ballots in excess and

(Continued on Page 12).

All over the State of New York on the evening of May 5, rural people will gather in the local schoolhouse to transact the school business of the year. Chiefly because of the greater interest of rural school patrons in school matters, we have more attractive school buildings like this and better school facilities for our country boys and girls. We hope every voter in the A. A. family will attend the school meeting this year. In order to run a school meeting legally, read the questions and answers on this page.

THIS covered bridge at Blenheim, New York, is claimed to be the oldest single span covered bridge in the world. It is 232 feet long, between the stone abutments. It was erected in 1855. During the last ice harvest a year ago, a loaded truck weighing all of fourteen tons passed over it constantly. It was designed for double traffic, has two driveways, and the long structure is supported by a great arch of oak, concealed in the center between the driveways. This was originally a toll bridge, financed by a private company and designed and built by a Yankee craftsman in Vermont.

Although the structure is in excellent state of repair, a new State road is threatening it and it is probable that it will be replaced in the near future. However, local historical associations and town officials are making plans for an attempt to preserve the structure as having definite historical value.

Participating Policies On Automobile Insurance Are Popular With New York State Farmers

OUR net premiums last year increased 33½% over 1929. Farmers appreciate their opportunity to buy *Automobile Insurance on a profit-sharing basis*. This participating plan appeals to them strongly, probably because so many are members of cooperative organizations.

We allow 10% off "conference manual" rates as outright deduction when premium is paid. This is \$3.00 to \$10.00, depending on make and size of car or truck.

Also 10% additional deduction where policyholder has had no automobile accident during past 24 months.

This is a New York State Company, with Home Office in Buffalo, with Claims Service Branches throughout State, and claims representatives from coast to coast.

Owen B. Augspurger, President.

HOME OFFICE: BUFFALO, N. Y.

Write for rates and exact savings on your car and truck. Ask for Agency Proposition, if you think you would like to represent the "GUARDIAN." You may be in a good territory which is still open.

SAVE MONEY ON FRUIT TREES

We have to offer a fine assortment of Fruit Trees, apples, pears, cherry, plum and peaches. Also, Berry plants, flowering shrubs, roses, evergreens, ornamental trees, and perennials. Send for Bargain Catalog—FREE.

A.A.'s Western New York Farm and Home Talk

Spring On a Fruit Farm

By M. C. BURRITT

SPRING progressed normally in Western New York during the second week in April. Most days were fine and filled with sunshine. On one or two days it rained lightly and the wind blew cold off the lake, but that

M. C. Burritt

is spring. The streams have cleared and resumed normal levels and the boys have been fishing for lake suckers nearly every night, sometimes returning with a goodly number. Big wood piles have changed into ready material for the kitchen stove and the fireplace under the sharp, fast teeth of the buzz saw powered by the tractor. Yards have been raked and shrubs pruned—it has been Easter vacation—and generally everything is ready for nature's big push which is about to transform orchard and field.

During the week we made our first spray (other than that for peach leaf-curl) on a part of the apple and pear orchards. It was an oil spray against leaf-roller. For the past few years this pest has caused considerable injury—probably 10 per cent at least—on Twenty-Ounce and Wealthy apples and Bartlett pears. This is the third application of oil made on Twenty-Ounce apples. Previous applications have greatly reduced the injury and I hope that further ones will now be unnecessary. The oil destroys the egg clusters and the problem is chiefly one of coating all branches thoroughly.

Alfalfa As a Cover Crop

Conditions last week also permitted the plowing of ten acres of apple orchard which have been in alfalfa sod for four years. Results under sod conditions with some use of nitrogen have been very satisfactory in all respects and it is not for this reason that we are plowing this orchard this spring. Grass has come in so strong in parts of the orchard as to practically eliminate the alfalfa and the sod is getting tough. We have plowed quite shallow and have not tried to get close to the trees. We plan to work up the middles thoroughly and if we can get weeds and grass sufficiently subdued we will reseed to alfalfa in late June or early July. We have found alfalfa a very satisfactory cover crop. Meanwhile, cultivation will make nitrates available, as will the later crops of alfalfa and we can save the use of nitrogen, which has become increasingly necessary as grass replaced alfalfa.

Very reluctantly, because we do not

know anything about it and because we do not like it, we are going into the bee business. Experience during the past five or six years has convinced us that lack of sufficient pollination is generally a limiting factor in the amount of the fruit crop. This is not always true for sometimes conditions are so favorable that a good crop is set anyway. But in recent years at least, this has not been true in the great majority of pollination periods and one never knows in advance whether conditions will be favorable or unfavorable. Moreover when conditions are unfavorable is just the time when it pays best to have the crop. Bees are desirable insurance or are at least worth trying out for insurance. So we have secured hive material, assembling it, and have ordered package bees from the South. Much will depend on the weather and other conditions. Bees, of course, will not alone guarantee a crop.

The Farm Board Considers Fruits

During the past week at Washington, D. C. initial steps were taken to set up a national sales agency for fruits and vegetables in cooperation with the Federal Farm Board. These farm industries are one of two of the most important in the East and nearly the last to receive attention and help from the Farm Board. The problem is a most difficult one because of the proximity of the producing areas to our greatest markets and because it must deal with truck as well as carlot shipments. It will not be solved in one or two or five years.

This organization may not mean much to New York producers in the next few years. But in the long run it is vital to the future of Eastern fruit and vegetable growers. Whatever certain individuals may be able to do it is a fact that as a whole Eastern producers are gradually losing their best markets to the well graded, well packed, highly standardized carlot shipments of these products from distant points. The motor truck may be a great advantage to Eastern growers in reaching their markets more quickly and cheaply but it is making the problem of standardization and improving quality more difficult. It is a good sign that Eastern growers and the Farm Board are recognizing this problem and tackling it. It is to be hoped that one of the first things that will be done is to make a thorough study of the movement of northeastern produce to market by truck.—Hilton, N. Y., April 12, 1931.

The water garden does not need to be large or pretentious. A half barrel sunk below the level of the soil and filled with water can be made most attractive and interesting.

The value of cultivation in the vineyard is largely lost unless it is started at the earliest possible moment. Early cultivation kills grass and weeds which rob the plant of moisture and plant food and promotes the natural process whereby nitrogen is made available.

SALISBURY, MD.

Quack Grass--Our Worst Weed

WE have read of numerous plans for eradicating quack grass, yet in spite of all varieties of recommendations, the number of people who fail to get rid of it far outnumber those who are successful. Thousands of acres of the most fertile land in New York State are badly infested with this weed which, in our opinion, does more damage than any other weed in the state.

Anyone who is planning to start war on this pest will do well to use strategy and attack it at its weakest point. Quack grass has two weaknesses, namely, that when it is undisturbed for some time the roots develop relatively close to the surface of the ground and that the plant can be weakened and eventually killed if green growth is entirely prevented.

Cost Must Be Reasonable

When we are considering a plan of attack we need to keep several points in mind. First, any method of control or eradication should not be too expensive. For example, someone might discover a new chemical that would entirely eradicate it, yet the plan would not be rapidly adopted if costs run somewhat around \$50 to \$75 an acre. It is also important, if possible, that we get a plan which will not require that the land lay idle a year. Let us consider for a moment how we could handle the situation this spring.

Take, for instance, land that was in corn, potatoes, or some other cultivated crop last summer and is to be sowed to oats this spring. If it was plowed last fall, begin cultivation just as soon as you can get on the land this spring and cultivate it at intervals of a few days just as many times as you can before the oats are sowed. In fact, delay the sowing as long as you can and still be reasonably sure of getting a crop. You might substitute barley for oats as this usually does fully as well as oats when sowed late. That treatment will probably not eradicate quack but will weaken it some and give you a better oat crop.

Do Not Let Seeds Ripen

Where oats were sowed last summer there is not much that can be done until another cultivated crop comes around, except to cut the hay early enough so there is no danger of the quack's going to seed. If it becomes ripe some of the seeds will go into the bedding and when put on the fields will spread the quack grass to other parts of the farm.

Let's think for a moment of land where a cultivated crop will be put on this spring. Here we have a better chance for effective control. If it was plowed last fall, begin cultivation just as soon as possible or if it is to be plowed this spring, plow it just as soon as you can and then cultivate it frequently. If the grass is killed just as often as it sticks its head above the ground, the root stocks become weaker and weaker and finally die.

After the cultivated crop is put in, run over it with a harrow before it comes up, then begin cultivating just as soon as the rows show. This will weaken the plant but will not eradicate it. Then next fall either plow shallow or preferably disc the land without plowing as often as necessary to prevent the growth of quack before freezing winter sets in. This treatment followed by more thorough harrowing before the oats are put in will just about eradicate quack grass. It is not easy and requires persistent effort. Just about the time you think the battle is nearly won is the point where you need renewed care and energy. If you relax your efforts the grass will take unfair advantage of you and in a year's time will be as strong as ever.

There is another possibility this spring in view of the prospective short hay crop in many sections. You could take either land that grew a cultivated

crop last fall or meadows that are in poor shape, plow them early, cultivate often and thoroughly, then later in the spring plant some quick growing emergency hay crop such as millet. This will mature fairly quickly so that you can get it off the land early in the fall and then proceed with the fall treatment as already outlined. This would have the added advantage of quack control and an emergency hay crop for next winter.

Give Us Your Experience

We realize that there are other excellent methods of controlling quack grass. Some depend on the smother crop system. We would like to point out, however, that it is asking too much of a smother crop such as buckwheat or sowed corn, when you plow land badly infested with quack grass late and expect the smother crop to kill the quack. Before planting the smother crop you need to weaken the quack by methods already suggested.

We would be glad to hear from readers who have been successful in attempts to kill quack by other methods.

Celery Information Available

A NEW celery bulletin which describes methods of eighty-one New York state growers is now available from the New York state college of agriculture. This is the first publication about celery issued by the college and one of the few available in the United States. New York state is third among states in growing celery being exceeded by California and Florida, both growers of early celery. New York leads the late crop states, followed by Michigan. In 1929, New York had 1,363,000 crates. Wayne county grows the most celery followed by Monroe, Oswego and Ontario. The study makes recommendations for varieties, planting, seed, fertilization, cultivation, spraying, and harvesting. Ask the office of publications at the New York state college of agriculture for P-517. It is free.

Liming Vegetables

BEETS, lettuce, onions, spinach are sensitive to a sour soil, while cauliflower and muskmelons are less so. Most vegetables grow best on land that is slightly acid or neutral. When a soil gets too acid, toxic or poisonous compounds are formed, while if a soil has too much lime, desirable plant foods are deposited at the surface, making them useless to plants. Tests are now used which show how acid or alkaline a soil sample really is and show the amount of lime necessary to change a sour soil to alkaline.

The removal of calcium in the drainage water makes soil acid. This removal is hastened by cultivation, though it takes place even in forest soils. Only a few fertilizers lessen acidity. Of these, calcium cyanide, calcium nitrate, basis slag and nitrate of soda are the most important, but their effect is not so great as lime in sweetening the soil.

How to Use Legume Inoculants

What is the best way of using a commercial legume inoculant?

SOME commercial inoculants come in sand, others come in a liquid form. Where the inoculant comes in sand all that is needed is to mix it with the seed just previous to planting. If it comes in a liquid form it may be advisable to mix it with a little sand before adding to the seed.

Cabbage is a suitable feed for dairy cows when properly fed. It should be fed shortly after milking

No crows in your corn all summer

—if you coat the seed with Stanley's Crow Repellent. No waiting for seed to dry. Stanley's Crow Repellent will not clog planter. Non-poisonous but positively keeps out crows, gophers, moles and other corn field pests. Saves time and money in replanting.

Guaranteed. Large can \$1.50, enough for 2 bu. seed corn (8 to 10 acres). Small can \$1.00. If your seed, hardware, or drug store can't supply you, order today from The Cedar Hill Formulae Company, Box 500-M, New Britain, Conn.

STANLEY'S CROW REPELLENT

"Your repellent is the only thing I have used with complete success." S. Shepherd, West Townsend, Mass. "Crows were in my field every day but pulled no corn," writes J. A. McDonald, Clarion, Pa.

CATTLE

Bull Calves

Let your surplus milk grow your next Herd Sire, bred for Type and Production, sired by a 1000 lb. bull.

We are oversupplied with bull calves and offer the following at the bargain price of

\$100 EACH

Calf born Nov. 21, 1930 Dam's record at 4 yrs. 17,747.9 lbs. milk, 593.1 lbs. fat.
Calf born Dec. 8, 1930 Dam's record at 3 yrs. 18,894.5 lbs. milk, 634.7 lbs. fat.
Calf born Feb. 16, 1931 Dam's record at 2 yrs. 17,988.1 lbs. milk, 544.0 lbs. fat.
Calf born March 1, 1931 Dam's record at 3 yrs. 24,438.9 lbs. milk, 653.3 lbs. fat.

These calves are sired by a grandson of the famous Sir Pietertje Ormsby Mercedes 37th and the famous Segis Pietertje Prospect. The sire's dam has a record at 3 years of 1037.22 butter with 20,890.80 lbs. milk. Every calf is a good individual.

Early Pasturing Damages Grass

A NEIGHBOR of ours used to say, "Always feed hay till the middle of May." There are some localities where it is possible to turn out much before the middle of May and in some of our northern sections this time would be too early for the good of the pasture later in the season. But in general it is a good practice especially with high producing cows, to feed hay until weather conditions are such that the cows can be turned out both day and night.

About this time of year when the bottom of the hay mow is in sight and the grass looks green it is a temptation to open the barnyard gates and let the cows forage for themselves. The time to pasture, of course, depends on the individual condition. It will vary with the season and with the locality. However, several things that apply generally to all the dairying sections need to be remembered when the grass begins to look green. The close cropping of the fresh shoots often kills the new plants entirely during the early part of the season, leaving nothing later in the summer. When the grass first starts to grow, the ground is not yet entirely settled and if the herd is turned out, serious injury will be done.

The fact that a fertilized rotated pasture will make an earlier growth in the spring and in consequence will be available from one to two weeks earlier than hill pastures so familiar on many dairy farms, is an important consideration. Of course, it does not

always pay to fertilize but it is a factor to be thought about.

Perhaps the best solution is to wait, under ordinary circumstances until the land in the pasture has settled after the spring thaws and the grass has a good start. One day's pasturing too early in the spring will mean the loss of a ten day's pasture later in the summer.

Bone Meal for Cows

THE Pennsylvania Experiment Station reports that dairy cows that received a bone meal supplement in addition to a grain ration, produced calves that were considerably larger at birth than those who did not get the bone meal. There also appeared to be a tendency for those who received the bone meal to go off feed less easily than those getting the ration without it.

Scours in Calves

SCOURS in calves are usually caused by wrong feeding. It is easily prevented and readily overcome but attention should be given at once. Keep pails and feeding utensils clean and feed carefully. If scours appear, cut the feed in two and give about 4 oz. of castor oil. Also give a little linseed tea and a couple of ounces of lime water. Do not feed succulent or spoiled foods. Cut down the amount of feed or omit one feeding entirely.

Make the Surplus Milk Into Butter

(Continued from Page 3)

of the fat globules has a marked effect on the churning quality of cream. The large globules come in contact with each other much more readily than the small ones do. The size of these small divisions of fat in milk and cream is probably affected by the same factors that control the condition of the fat. Very often a "stripper's" cream is difficult to churn because the fat is hard and the globules are small.

Amount of cream in churn—The churn should be one-third to one-half full. There must be enough cream to fall nicely, and yet not so much that sufficient agitation does not take place.

Speed of churn—The greatest possible agitation is desirable. Therefore, the churn must be speeded carefully, neither too slow nor too fast. Just before the cream breaks, it is very thick and it adheres to the walls of the churn. At this stage of the churning process the speed of a hand churn should be lessened.

Undesirable microorganisms—Certain microorganisms, such as rosy milk bacteria and yeasts, prevent the cohesion of the globules. Difficult churning is the result. Fortunately, this condition does not often occur. If, however, these bacteria cause trouble, the utensils should be thoroughly scalded in boiling water. When these precautions fail, usually a tablespoonful of salt added to each gallon of cream will so affect the casein that the globules will gather readily.

The churning process is nearing completion when the glass becomes clear. The particles of butter should be about the size of a pea or of a kernel of corn, for the buttermilk drains off more readily when the granules are of this size than when they are very small. If churned too long, too much buttermilk is incorporated in the butter.

Now let us consider the subsequent steps in the manufacture of butter on the farm. In washing the butter, pour in just enough water into the churn to aid in draining off the buttermilk. Add a little more water than there was buttermilk drained off. It should be washed twice. The temperature should be about

54 degrees or 58 degrees F. If it is too high, the butter will be greasy. If it is too low, the butter will be too hard to allow the salt to be worked in properly. If the butter is hard, extra working is required, and it is likely to be tallowy.

After washing, place the butter on the worker or in the bowl, which has first been thoroughly soaked in hot water, then cooled, and distribute the salt over it. If the salt is hard and dry, or cold, so that it dissolves slowly, it is well to place it in a vessel and just cover it with water at the same temperature as the wash water, or perhaps two or three degrees higher. After standing a few hours, the salt will be softened and warmed, and will dissolve in the butter much more quickly than when very dry or cold. The amount of salt will depend on the market. The average is one to one and one-half ounces for each pound of fat.

The purpose of working butter is primarily to distribute the salt and moisture, and second, to compact the butter. When working by hand, do not give the ladle a sliding motion over the butter, as this will make it greasy. The working process may be done in a bowl, in the churn, or on a worker. Sometimes it is well to let the butter stand for the salt to dissolve before the working process is completed. If the butter has not been worked sufficiently, motes may be found in it after it has been in cold storage for a day.

The best farm butter is made by persons who are scrupulously neat in milking, in churning, and in cleansing the utensils. In order that the tinware as well as the woodenware be free from bacteria they must be thoroughly scalded with boiling water after each churning. And we must remember that butter absorbs taints readily. It should not be kept in the refrigerator or in the cellar with vegetables, meats, and the like, unless in an air-tight package. In the majority of places where butter is stored, a sufficiently low temperature is not maintained. A refrigerator with plenty of ice is the most satisfactory method of cooling, and, at present on the average farm it is the most desirable means of maintaining low temperatures.

Wonderful Success

In Raising Baby Chicks

Mrs. Rhoades' letter will no doubt be of utmost interest to poultry raisers who have had serious losses in raising baby chicks. We will let Mrs. Rhoades tell her experience in her own words:

"Dear Sir: I see reports of so many losing their little chicks, so thought I would tell my experience. My first incubator chicks, when but a few days old, began to die by the dozens. I tried different remedies and was about discouraged with the chicken business. Finally I sent to the Walker Remedy Co., Waterloo, Iowa, for a box of their Walko Tablets to be used in the drinking water for baby chicks. It's just the only thing to keep the chicks free from disease. We raised 700 thrifty, healthy chicks and never lost a single chick after the first dose."—Mrs. Ethel Rhoades, Shenandoah, Iowa.

Danger of Infection Among Baby Chicks

Readers are warned to exercise every sanitary precaution and beware of contaminated drinking water. Baby chicks must have a generous supply of pure water. Drinking vessels harbour germs and ordinary drinking water often becomes contaminated and may spread disease through your entire flock and can cause the loss of half or two-thirds your hatch before you are aware. Don't wait until you lose your chicks. Take the "stitch in time that saves nine." Remember, that in every hatch there is the danger of some infected chicks. Don't let these few infect your entire flock. Give Walko Tablets in all drinking water for the first two weeks and you won't lose one chick where you lost dozens before. These letters prove it:

Never Lost One After First Dose

Mrs. C. M. Bradshaw writes: "I used to lose a great many of the little downy fellows, tried many remedies and was about discouraged. As a last resort I sent to the Walker Remedy Co., Dept. 422, Waterloo, Iowa, for their Walko Tablets for use in the drinking water of baby chicks. I used two 50c packages, raised 300 White Wyandottes and never lost one or had one sick after using the Tablets and my chickens are larger and healthier than ever before. I have found this Company thoroughly reliable and always get the remedy by return mail."—Mrs. C. M. Bradshaw, Beaconsfield, Iowa.

You Run No Risk

We will send Walko Tablets entirely at our risk—postage prepaid—so you can see for yourself what a wonder-working remedy it is when used in the drinking water for baby chicks. So you can prove—as thousands have proven—that it will stop your losses and double, treble, even quadruple your profits. Send 50c for a package of Walko Tablets (or \$1.00 for extra large box)—give it in all drinking water and watch results. You'll find you won't lose one chick where you lost dozens before. It's a positive fact. You run no risk. We guarantee to refund your money promptly if you don't find it the greatest little chick saver you ever used. The Pioneer National Bank, the oldest and strongest bank in Waterloo, Iowa, stands back of our guarantee.

Walko Tablets are sold by leading druggists and poultry supply dealers.

Cannibalistic Chickens

"CANNIBALISM is a bad habit brought about by improper feeding of too many chickens in too close quarters indoors, and a lack of something to do," according to Professor J. E. Rice of Cornell University. Chicks like to be busy and to pick at something and when picking has been carried to the point of producing blood, the chicks are likely to become cannibalistic and eat the toes and even the bodies of their companions.

Various remedies have been suggested to cure cannibalism, and all probably have their good points, but at times it seems that even the application of all these remedies does not cure cannibalism, and it is certainly a distressing sight to see two or three week-old chicks picking each other to death. The first thing to do in any case, is to correct the conditions that have brought about the vice by keeping the chicks busy at all times.

Three hundred chicks in one colony house is probably all that it is ever advisable to brood. A little rain or wind is to be preferred to close confinement. If at all possible, let them run on free range after they are six or seven days old. There should be plenty of shallow mash troughs so that every chick has an equal opportunity to eat, and the ration fed should include green food, milk, cod liver oil, and minerals.

Even with the best of care and food sometimes the vice will break out and in such circumstances, some other method of treatment must be followed.

Painting the injured parts with pine tar is a remedy that works quite frequently. Two or three commercial products are also put out that serve the same purpose as pine tar and have been used with more or less success. The feeding of shredded cabbage, sliced onions, or other green food several times a day will give the chicks something to do and cause them to forget their cannibalistic tendencies. The darkening of the colony house for the first few days has been suggested so that the chicks do not pick at the bright spots on each others' feet. Another recommendation is the painting of the colony house windows blue, so that the red on the chick appears dark.

If breeders are selected carefully and normal methods of management are followed, the chicks fed on good food and allowed plenty of room to exercise, cannibalism can be prevented. It is much easier to prevent toe picking, feather pulling, and body picking before it makes an appearance than to wait and try to cure it afterwards.

Lights in the Brooder House

IT has been proven that a night light in the chick brooder house is worth while. A lighted house permits the chicks to re-arrange themselves at night and act much as they do in the day time. This lessens the risk of chilling and prevents crowding. The advantages of a small electric light in the brooder are as follows:

- Prevents crowding.
- Lessens danger of chilling.
- Makes for uniform growth.
- Induces earlier roosting and stimulates food consumption.

Care should be taken that bright lights are not provided or too rapid growth may occur.

Battery Brooders

THE New Jersey Agricultural Experiment Station recommends the simplification of management and care of chicks by the use of the battery brooder on large commercial farms. The combination of battery and floor brooding by removing little chicks from the battery, when they are 3 or 4 weeks old, to a heated room in which they are hardened off, accomplishes all

(Continued on Page 12)

the **ODDS** *are*
against you
with a POOR FEED

No one is foolish enough to deny that milk prices are down—that dairy profits have shrunk—that it is a time to practice economy in the strictest sense.

But there is another fact to face—another truth to realize; *the odds are against the dairyman who cheapens his ration.* He invites every danger he avoids when times are good. He turns right about face on good dairy practice. He deafens himself to the truth that, now, only good cows and a good feed can make him a profit.

Run down condition, ill health, constipation—low profits—all are waiting to respond to the invitation cheap feeding gives.

The best way to get rid of surplus milk is to send low producing cows to the butcher. Keep only high producers—feed them well. That's true economy! That's profitable dairying!

Regardless of milk price Larro dairy feed will return a greater profit over feed cost. Larro plays square with your cows because it is always the same—always uniform. *It always is the most profitable.* See your Larro Dealer.

Butter Suffers Severe Break

CREAMERY SALTED	Apr. 18, 1931	April 10, 1931	Apr. 19, 1930
Higher than extra	25 1/2-26	28 -28 1/2	40 -40 1/2
Extra (92 sc.)	25	27 1/2-	39 1/2
84-91 score	23 1/4-24 1/4	25 1/2-27 1/4	33 1/2-39 1/4
Lower Grades	22 1/2-23	24 1/2-	31 1/2-33

An earthquake or something equally severe hit the butter market during the week ending April 18 and knocked things flatter than a pancake. The

market closed at 2 1/2c below the closing rates of a week ago. A number of factors were responsible for the situation although the main influence has been from the extremely heavy supplies. Not only are supplies heavier but the indications are that they will increase, as reports from the chief producing sections indicate a steady increase in the make. The inability of the market to clear the heavy, fresh arrivals created heavy selling pressure and undermined the confidence of the trade. Chicago suffered a severe break carrying their prices considerably below those of New York, which in turn weakened in sympathy.

Retail prices have been reduced quite generally. Several of the larger chain stores are offering fancy butter at 29c. It is hoped that this will improve the situation.

On April 17 the four principal cities reported storage stocks totaling 6,469,108 pounds compared with 8,879,660 pounds on the same day a year ago. From April 10 to April 17, holdings in the four cities were reduced 116,232 pounds. During the same period last year holdings were reduced 900,490 pounds.

No Improvement in Cheese

STATE FLATS	Apr. 18, 1931	April 10, 1931	Apr. 19, 1930
Fresh Fancy	14-15 1/2	14-15 1/2	18-18 1/2
Fresh Average			
Held Fancy			24-26
Held Average	21-22 1/2	21-22 1/2	23-

It is very apparent that the lower prices existing in the cheese market failed to attract trade. As a matter of fact, the market is even weaker on fresh Western makes which have been offered locally and for future delivery at lower prices. In spite of these bargains, interest in fresh cheese is lacking.

Prices have not changed to any extent during the week on fresh New York State flats. There is so little doing in the market that it is almost impossible to get any definite line on the situation. On April 16 the ten cities making daily reports had in cold storage 10,688,000 pounds whereas last year they held, at the same time, 11,701,000 pounds. From April 9 to April 16 holdings in the ten cities increased 231,000 pounds. A year ago during the same period the same cities reported a reduction in holdings of 293,000 pounds.

Egg Market in Bad Shape

NEARBY WHITE	Apr. 18, 1931	April 10, 1931	Apr. 19, 1930
Hennery	22 1/2-24	23 -24 1/2	30 -31
Selected Extras	21 1/2-22	22 1/2	29 -
Average Extras	21	21 1/2-22	27 1/2-28 1/2
Extra Firsts	20 -20 1/2	21	26 1/2-27
Firsts	20	20 1/2	26 1/2-27
Undergrades		19 1/2	20 1/2
Pullets			
Pewees			
NEARBY BROWNS	Apr. 18, 1931	April 10, 1931	Apr. 19, 1930
Hennery	22 -23 1/2	23 -25	29 1/2-31
Gathered	18 -21 1/4	20 -22 3/4	26 -29 1/4

On April 18, the market closed with the New York wholesale egg market far below par with the Chicago spot market. Receipts during the early part of the week were heavy. At the same time, the distributing trade is in very bad shape, not having recovered from the post-Easter slump. As a result the market was practically dependent upon the speculators. Such a situation is bad.

Some of the large Western shippers are storing their eggs rather than sacrifice goods and take heavy losses. On Thursday and Friday straight cars of storage packed eggs were thrown on the market at outside quotations without takers. These goods range anywhere from 19 1/2c to 20 3/4c per dozen with some extra fancy marks bringing premiums over closely selected stock making them equivalent to 21c to 21 1/2c. There is very little of this premium business going on, as buyers are experiencing very little difficulty in obtaining top grades without paying a premium.

Nearbys are naturally experiencing trouble. However, they are replacing some of the higher costing Pacific Coast eggs in the chain store business, especially the fancy Jerseys.

It is to be expected that the into storage movement would be heavy. On April 17 the ten cities reported holdings totaling 1,914,000 cases. On the same day last year, holdings totaled

1,987,000 cases. From April 10 to April 17 holdings in the ten cities increased 452,000 cases, whereas during the same period a year ago holdings increased 358,000 cases.

The live poultry market in general closed a shade better than it did a week ago. Fowls have been selling better and broilers are a shade higher. This is the time of year when light fowls are getting the call and they usually bring 1c above the heavier birds. As a consequence Leghorn fowls have been in strong demand with some premium business.

Broilers have not been in excessive supply. Leghorn broilers are becoming more plentiful and as yet they are holding well up to Reds, top Reds beating them by only 1c. Those who are shipping Leghorn broilers can add on a little extra return if they will exert a little care in the handling of the birds before shipping. Finish may mean 2c or 3c per pound. Some men may say the extra care does not warrant the return. That may have been true a couple of years ago but every nickel counts in this day and age in this man's world.

The above quotations taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Wheat futures advanced under reports of continued dry weather in the Canadian Northwest and a greater export demand to the extent that they have reached the best prices since February 20.

The Canadian and American Northwest wheat areas have been experiencing a severe spell of dry weather. Weekly forecasts give very little promise of this dry spell breaking. Weather forecasts indicate little or no precipitation in any section of the country with warmer weather predicted for the coming week. A special communication to the New York Times states that on the night of April 17 the worst dust storms in years were reported in parts of Southern Alberta. It goes without saying that should the spring wheat area receive rain, a break in the market can be expected.

Hay Market Unchanged

The hay market is substantially the same as it was a week ago. Receipts have been light to moderate in Manhattan and Brooklyn. The Brooklyn market has been much better than the New York market. Prices in both sections remain unchanged. Straight timothy grading No. 1 still brings \$26 to \$27 with other lines working as low as \$21 for No. 3 in small bales. Timothy containing a light mixture of clover brings from \$20 to \$25 while grass mixtures bring from \$19 to \$23. Sam-

ple hay brings \$18 to \$19. Rye straw has been in active demand. Supplies have been extremely light and prices have jumped from \$19 to \$20. Oat straw brings \$12 to \$14, wheat \$13.

Farm News from New York

New York State Crop Conditions---Farm Board Meets---Farm Notes

THE New York State crop report for April contains a number of things of interest to New York State farmers. The snow during March, though bad for traffic, was of great value in furnishing covering for meadows and moisture for fields badly in need of it.

On April 1, the winter wheat crop seemed to be in a better condition than normal with the average condition for the State reported to be 89% of normal compared with 79% of last April and the 10-year average of 86%. The State condition is about the same as that of the United States. The condition of winter rye is also very good with a 90% normal crop indicated as compared with 81% last year.

Pastures

From present appearances pastures will be late since they were still under a good blanket of snow on April 1st in many of the dairy sections of the state. Condition was reported to be about 82 percent of normal compared with 78 last April and 87 the six-year average. Pasture condition on April 1 in New York is mostly a reflection of winter conditions, since growth has not started. April 1 pasture conditions were below the usual April 1 average throughout most of the United States.

Fewer Chicks Hatched

An interesting feature of the report is the fact that the number of chicks hatched is way below that of a year ago at this time. The number of chicks

hatched in New York State was 24% below that of a year ago March, while for the entire United States it was 37.6% below. Decreasing bookings of chicks for future delivery was also noticed. Some hatcherymen are brooding chicks with the expectation that they can dispose of them to poultrymen at a later time. Indications are that most farms are buying fewer chickens this year, or else they are planning to get them later on.

The potato situation has not changed greatly from a month ago, conditions of early potatoes in the Southern states being somewhat better than on the same date last year, with the only unfavorable conditions being in Texas. The commercial early crop in Florida and Texas is estimated to be 8% smaller than last year which is about the average over the 5-year period.

Certified potato production in all principal states except New York was cut sharply in 1930 because of unfavorable growing conditions. The total U. S. production was about three quarters that of 1929, while New York production was better than 602,000 bushels compared with 572,000 in 1929.

While the outlook as a whole maybe dark, the conditions of New York State agriculture are considerably better than that of the average in the United States.

Cabbage Production Forecast

Cabbage growers will be interested in the acreage and production forecast in the early and intermediate states.

The estimated acreage for the second early group of states is six per cent smaller than 1930, and seventeen per cent smaller than the average for the five year period. However, the yield per acre is expected to be eight per cent above last years' and productions forecast at 96,000 tons is four per cent greater than the estimated production in 1930. The production forecast for other states reported to date, is that a yield forty per cent larger than last year can be expected and fourteen per cent larger than the five year average. Growers in New York State can take advantage of these figures by curtailing their acreage so that production will not exceed demand and a moderate price can be obtained for their product.

Farm Board Meets

AT the close of a series of conferences held in Washington, D. C.; Jacksonville, Florida; and St. Louis, Missouri; the Federal Farm Board has announced the selection of a committee composed of fourteen members to develop the details of the proposed co-operative terminal market sales agency for the selling of miscellaneous fruits and vegetables. Representatives from various states were present at these conferences and all seemed in favor of the establishment of a central grower-owned and controlled sales agency for the handling of fruits and vegetables at the terminal markets. New York State is represented on this committee by Mr. W. J. Hall, of the Western New York

Co-operative Packing Association at Lockport, New York.

If plans materialize the new co-operative will handle potatoes, onions, cabbages, and other fruits and vegetables which are not now distributed by national co-operative agencies. The fruit and vegetable co-operative is another of a series of national agencies that have been organized by the Farm Board and everyone waits with interest the effect it will have on the industry. It should bring about a better co-ordination of all agencies involved in the producing and distributing of perishable products.

North Country Agricultural Clubs Hold Tournament

THE Young Farmers Clubs of Northern New York held a basketball tournament and rally at the State School of Agriculture, Canton, N. Y. on March 28th.

Gouverneur, Madrid, Chateaugay, and Malone were represented, the elimination games being played in the afternoon and the final and consolation games in the evening.

A delicious banquet was served by the girls of the Home Economics Department, with forty-eight in attendance. The banquet was served in Payson Hall and afterwards Darcy Goodenough of Gouverneur, President of the North Country Section, presided at a brief business meeting.

Plans were made for a Spring rally at Chateaugay early in June, in which baseball, quoits, running races, and cattle judging will be the principal features.

When the business session was over, Professor H. L. Brew of the State Department of Education, Division of Health Education, gave an interesting

(Continued on Page 17)

New York County Notes

Columbia County—Two inches of snow one night last week, but the sun soon melted it in the morning. Windy March weather half of the week, two nice warm sunny days; one day of April showers followed by sleet. Many pheasants are so tame they come to the barnyards and eat with the poultry. Sixty were released in Chatham last fall. Several hundred have been released in the past five years. Water is high in the trout streams and the largest trout reported as being caught weighed 4¾ pounds. There are seventeen 4-H club members enrolled in a new strawberry project. Each boy has to start with at least one hundred plants. Professor J. Oskamp of Cornell is to give planting demonstrations on April 15 to the boys; after this meeting the boys will receive their plants.

A Chatham man shipped forty-three cattle to Boston and drove there with horse and buggy. He demanded a place for his horse of the hotel clerk who was obliged to engage a garage according to an old law.—Mrs. C. V. H.

Tioga County—Farmers are leasing their land for gas and oil. Many leases are being filed in the County clerk's office. It is predicted that drilling will soon begin in this county.

The oil in the well on the farm of Frank Yates at South Apalachin is causing much comment, an organization has been formed, and an early development is anticipated.

Plenty of deer are seen in this county. At the home of Mr. S. B. Woodford above Candor, Mr. Woodford saw ten deer in one herd on his farm. There are other herds seen near Owego, one of eight, and one of five seen frequently. It is estimated that around three hundred deer are inhabitants of our county. And if so, what a menace they will be to the crops and fields of the farmers the coming summer; as deer cannot be fenced out.

Announcement made by the State Department of Farms and Markets, in Albany, is that the Tioga County Agricultural Society is to receive \$5,682.30 in state aid for its 1930 fair.

Postmaster S. W. Smith of Owego announces that "A new transcontinental air mail service which will take air mail from Owego to San Francisco or Los Angeles in forty-one hours will be put into operation this month.

On Tuesday, April 7th, a severe

snow storm visited this county. At Owego and along the southern tier from ten to twelve inches of snow fell. At Candor and Willseyville it was three or four inches deep. This storm was considered to represent the heaviest precipitation in 24 hours since last September.

The quality of the maple syrup and sugar made in Tioga County is grand and the quantity fair.

Plowing has been in progress for some time and an early spring is predicted.—Mrs. C. A. A. B.

* * *

Western New York Notes

AMEETING of the committee appointed to further the claims of the swamp-lands south of Medina as a Federal migratory bird sanctuary was recently held. 25,000 acres are now available, the entire area being 88,000 acres. It is said that according to data, this swampland is the ideal place for a bird refuge.

Sheepmen of Niagara and Erie Counties will ship wool from Akron April 29. With the wool market showing marked improvement during the last few weeks, sheepmen are expecting better prices for their product.

Cattaraugus County dairymen who are interested in the Holstein breed of cattle are to meet in Cattaraugus April 27 to consider the organization of a county Holstein breeders association. Professor S. J. Brownell of the animal husbandry department at Cornell, recently elected Secretary of the New York association of Holstein breeders will be present.

Pupils in public, private, and parochial schools of western New York, excepting Buffalo, are now in the final stages of the 1931 National Spelling Bee contest conducted in western New York by the Buffalo Evening News. Best spellers from each school enrolled will take part in the county finals on April 24. Each school enrolled will receive a picture of Washington monument suitable for framing and hanging in the schoolroom. The champion speller in each school will receive a dictionary and the second best a certificate of merit.

The champion and second best speller in each county will receive medals and be eligible to compete in the district finals. The winner of the district

finals will receive a week's trip to Washington at the end of May with all expenses paid, together with an escort of his or her own choosing whose expenses also will be paid. The second best will receive a thirteen volume edition of the New World Book Encyclopedia.

The champion speller while in Washington will take part in the National finals and share in the distribution of \$2,500 in cash.

Plowing is under way and to date, April 10, we have had one really warm beautiful spring-like day. Frogs are thawed out and noisy but according to rural tradition they have to freeze up three times before settled spring weather is really here.

The sugar season is at an end. Demand for syrup and sugar slow, with declining prices.

* * *

Wyoming County—The maple sugar season is at last at a close, after a better yield and a better price than was expected, and the contemplated spring's work is at hand. Since there has been little frost in the ground this year, and the early spring rains have been less frequent, it is expected that road building will begin early. Wyoming County is this year planning one of the most extensive road building projects, expecting to give work to thousands of men and at the same time increase the efficiency of Wyoming county highways, thereby setting an example for other counties to follow. The rights of way for the shortcut through Strykersville of the national highway, route 20, have been secured and it is expected that work will begin this spring on the construction of bridges.—A. S.

Genesee County—Farmers are plowing, roads are dusty, and winter wheat needs a rain badly. Some farmers are repairing fences. We are having nice warm weather.

A talk on "Landscaping Home Grounds" was given by Professor Donald Bushey, of the horticulture department of the New York State Agriculture at the Batavia Court House April 7. About one hundred and forty people were present. Forty-five enrolled in the Genesee County "Beautification of Home Grounds" which is sponsored by the Farm and Home Bureaus and 4-H Department.—Mrs. R. E. G.

DAIRYLEA

Dried Skim Milk

A Quality Product

For Poultry, Calves, Pigs

DAIRYLEA Dried Skim Milk in poultry rations, insures growth and health. Strongly recommended by feeding authorities. The ideal food for growing chicks. Increases egg production and improves hatchability in layers and breeders. Also excellent for calves and pigs.

Manufactured in plants of the Dairymen's League Cooperative Association, Inc. from the same high quality milk that is approved for New York City. Guaranteed by years of careful laboratory analysis and experiment.

Carried by local feed dealers and feed stores. If there is no representative in your town, order direct from New York office.

Packed in 100 lb. bags and 150 lb. Barrels

(Continued from Page 9)

that modern science desires in chick rearing.

In a bulletin called "The Operation of Battery Brooders", which may be obtained by writing the experiment station at New Brunswick, additional details on battery brooding are given.

How to Run a School Meeting

(Continued from Page 5)

destroy them, and then count the remaining ones.

The persons receiving a majority of all the votes cast are elected to the offices for which they were voted. The chairman must declare to the meeting the result of each ballot as announced by the inspectors. He has no authority to decide as to the legality of the election. If no person receives the majority of the votes cast, or if there is a tie, a new ballot must be taken.

Supposing a trustee or other district officer is not present at the meeting and refuses to serve. What then?

A trustee may resign when elected at the meeting or he may file a written resignation with the district superintendent of schools.

Is it necessary to notify officers of their election?

Yes. The district clerk, or the one who acts as clerk at the meeting must notify all persons who were elected to office unless such persons were present at the meeting. All persons elected to district offices are deemed to have accepted such office unless they file a refusal to accept with the district clerk. If they do not thus file a notice, and do not execute the duties of their office they are then subject to fine.

What are the qualifications necessary to be able to vote at a school meeting?

All voters must be citizens, at least 21 years of age, and be residents within the school district for a period of at least 30 days preceding the election.

In addition to these general qualifications, every voter must qualify on at least one of the following:

1. Own or lease real estate in the district, or

2. Be a parent of a child or children of school age providing such child or children shall have attended the district school in which the meeting is held for at least eight weeks during the year preceding the meeting. Under this provision both the father and mother may vote; or

3. If not a parent, a person may vote if he has residing with him or her a child or children of school age who has been in school for eight weeks in the year preceding the meeting, but under this provision only one person in the household may vote; or

4. Owns any personal property assessed for \$50 or more.

Now, in addition to these general qualifications we have had questions in the last several years of special situations involving the qualifications of school voters. For example, here are some of the questions:

Can an alien ever be a legal voter providing he resides in the district, owns property, or has children of school age?

No. An alien cannot vote.

Is a man entitled to vote on account of the qualifications of his wife, or vice versa?

No. One must be qualified on his or her own account.

Must a person own any definite amount of real estate to vote?

The law does not require a definite

(Continued on Page 13)

BABY CHICKS

(Continued from Page 12)

amount of real estate, but as we have already stated if it is personal property that is used as a qualification, then it must be assessed for at least \$50.

* * *

When is a chairman of a school district meeting entitled to vote?

The chairman is entitled to vote on all questions, but he is not entitled to cast a deciding vote in case of a tie, if he has already voted on the question.

* * *

Supposing a person is only a temporary resident of a district, may he vote?

No. The law specifies that he must be a bonafide or real resident. The place where a person actually lives is deemed by law to be his residence, and when a person moves from one place to another with the definite intention of making the latter place his permanent residence, it immediately becomes his legal residence.

* * *

What happens when a school district meeting is conducted illegally?

The proceedings will be set aside by the Commissioner of Education on appeal. They will not be set aside, however, if the illegal vote cast would not change the results of any proceedings of such meetings.

* * *

How may a voter at a school meeting be challenged?

Every qualified voter at a school district meeting has a right to challenge any person whom he knows or has cause to believe is not qualified to vote in the district. The person so challenged cannot be sworn, nor asked any questions as to his qualifications, but the chairman of the meeting must require such person to make the following declaration:

"I do declare and affirm that I am, and have been for 30 days last past, an actual resident of this school district, and I am qualified to vote at this meeting."

Any person who shall make such a declaration is entitled to vote upon all propositions which arise at such meeting. If he will not make such a declaration, he cannot vote. Neither the meeting nor the officers of such meeting have authority to pass upon the qualifications of any voter; even if the officers of such meeting know that the declaration made by a person challenged to be false, they cannot refuse to accept his vote. The proper course to pursue is to accept such a vote and proceed against the offender as the law provides.

* * *

Supposing a school district fails to hold its annual meeting. What then?

If the time of the annual meeting has been passed and such meeting has not been held, the trustee or clerk of such district should call a special meeting to transact the business of the annual meeting. If these officers fail to call such a meeting within 10 days, the district superintendent of schools must give notice that a special meeting should be held.

* * *

Is there a different procedure at annual meetings for different kinds of districts, like common school districts, union free school district, and central school districts?

Yes. The above questions and answers all apply to the common or one-room school districts. The procedure at annual meetings is varied somewhat with the other kinds of districts and the procedure is a little different also for special school meetings.

May we add in conclusion that there is nothing more important than the education of our boys and girls, and it is to the interest of every citizen, whether he has children or not, to attend the annual school meeting, and

Our 260-egg trapnested strain is famous throughout the country for its large size, high production and vigor.

When Writing Advertisers, Be Sure to Mention American Agriculturist

It's Mother's Day

Give It an Original Turn and She Will Be All the More Surprised and Pleased

Of course we will pin a carnation on dress or coat, help sing some lovely songs about Mother, and listen to a sermon or address in her honor. But wouldn't it be a good idea to have something special for her, say a shower at the breakfast table?

If small gifts are to be given such as lingerie, lace, handkerchiefs, or some little vanity that Mother would enjoy, wrap each in pink crepe paper, ruffling the edges and then notching them to suggest carnation petals. Place these on a square of bright green crepe paper as a centerpiece. Directly over it suspend (from the lighting fixture) a toy watering pot, and let a tiny silvered wire, like a stream of water run from each hole in the watering pot, to the big carnation below. The effect will be very pretty.

The whole family could club together for some large gift, an electric percolator, waffle iron, grill, toaster, or such appliance to delight the heart of a housewife. Wrap it in pink paper and with a bit of pink ribbon or silver cord, attach a card with the following verse:

*She sure deserves a present,
This mother dear of ours,
So we'll do more than wear for her
Some pink carnation flowers.
We've brought a gift to please her,
And may it tell her, too,
"There isn't any mother
Who's quite as nice as you!"*

What mother wouldn't be pleased with that? The gift may be placed at her plate, or one of the little boys, costumed as a mail pilot, could bring in the "airmail".

If there must be mystery about the gift, after breakfast suggest that mother go "picking carnations for the folks to wear. Placed here and there about the rooms are carnations, each accompanied by a slip of paper, bearing the name of one of the givers and suggesting where mother look for her gift. When the last one has been collected the lovely gift is disclosed, and mother has a carnation to pin on each giver. In the case of small gifts, a

present could be placed with each flower.

Mother hasn't outgrown her love for surprises and loving gifts; let's not only pin on carnations in her honor, but give her a gift to show our appreciation.—Elsie Duncan Yale.

Tested Recipes

Ham Sandwiches

Grind one pound of baked ham through fine knife of grinder. Grind one cupful dried beef, and mix these with one tablespoonful of vinegar. Use between slices of bread or, for a luncheon dish, scoop out the inside of small tea

Quilt Blocks

We have originated six new patchwork designs which are most striking. These are stamped on fine quality white embroidery cloth, size 18 x 18 inches, and we are able to furnish as well the fast colored star cloth in rose, blue, lavender, or tangerine for completely finishing top of quilt in size 90 x 90 inches.

A quilt this size will require twelve of the stamped white blocks and three and one-half yards of the star cloth in whatever color desired for putting blocks together. Price of the quilt blocks, Nos. C3011 to C3016, if ordered singly, is 15 cents each; one-half dozen 60 cents; one dozen \$1.00. Three and one-half additional yards of the colored star cloth is \$1.65 or \$2.65 for all of the material to make the blocks for the entire quilt.

Order from Embroidery Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

biscuit, after cutting a slice from the top, and fill with the ham mixture. Replace the top and serve.

Macaroni Croquettes

Mince two cupfuls of ham with two cupfuls of cold cooked macaroni. Use either elbow macaroni or short lengths. Add one cupful thick cream sauce or gravy and pour out on deep platter. Have well chilled and make into croquettes. Dip each in crumbs, then in beaten egg, again in crumbs and fry in deep fat.

Hot Milk Cake

Beat two eggs, add one cupful sugar, and beat again. Sift one and one fourth cupfuls flour with two teaspoonfuls baking powder and a little salt. Stir into the egg mixture, flavor with vanilla and pour in one half cupful hot milk, beating briskly. Beat up and bake in quick oven. A frosting made of butter creamed with confectioner's sugar is excellent for this cake.—L. M. T.

Pleasure in Plants

It is quite possible to get in a rut when raising flowers—to plant sweet peas on St. Patrick's Day if the weather is favorable, and, later, to grow asters, pansies, and zinnias, nasturtiums and morning glories for vines and sweet allyssum for borders.

There are other flowers as lovely

and of as easy culture and their newness will add zest to our floral efforts.

Dusty miller, so old-fashioned as to be almost forgotten, is ideal as a border plant—it is like a ruffle of gray-green lace. Scarlet-runner beans (posy beans our grandmothers called them) are pretty vines and wave their flaming banners many days.

We read much anent larkspur (annual delphinium) but it is seen very seldom in rural gardens. Last year we grew white ones that had the fineness of texture, the flawless perfection and untinted snowiness of tuberose. There were purple and lavender ones, and several shades of blue and pink—one deep, rich blue so popular in annual delphiniums.

In a quarter of a century I have found Canterbury bells growing in but three gardens. My own are like purple velvet with throats of alabaster and have been sleeping under a sung robe of leaves.

We see many single, red poppies but where are the great pom-poms—pink, white, purple, lavender, scarlet—that can be grown in the same soil and with as little care as are the small silk (Flanders) poppies?

Is there not less excuse for unsightly back yards on farms than on town lots; we have so much room to store useful articles that are not ornamental and flower seeds are so cheap. A sprinkle of portulacca or poppy seed on the bare spots after removing boxes and boards will soon produce beauty spots. If poultry run at large, old poultry-netting laid flat on the flower beds protects the seed and the plants grow up through this.

Eyes that rest on dreary scenes when one is about daily tasks soon look for fairer fields, so let us make the grounds which we must see daily, clean, orderly places. Then shall our neighbors take notice and the contagion spread until there are miles of smiling farm homes beautiful with the simplicity of orderliness and sweet with the fragrance of flowers.—M. C. S.

Fashions and Patterns

A DRESS which looks wonderful on the wax figure in the store window may be hopeless when we get it home and attempt to wear it. There are definite reasons why this may be true but it is not always easy to analyze the case to see why it is so. There are certain unchanging principles of design which apply to every style, no matter what it may be. The first one is that each woman is an individual and must select from the fashions styles which are becoming to her own figure. She needs to emphasize her good points and minimize her bad ones. A becoming neckline or collar, a hat which does not make a broad face much broader or a thin face thinner, jewelry which enhances rather than disfigures can be chosen from this season's styles but should be tried on the wearer and not selected until this is done.

The ensemble idea has taught women a good deal about harmony in color. A foundation color should be selected for the season's outfit and everything, blouses, accessories, and all, should be selected to harmonize with it. By doing this it is much easier to obtain a pleasing appearance than by picking up garments here

and there without regard to the wardrobe as a whole.

There are fashions in color also. This season shows a great many browns, and brown with a white trim is very smart, indeed. But it would be a fatal mistake for a large woman to select a warm brown outfit because brown, being a warm color, makes a large figure look larger. Navy blue and black are equally smart and therefore a woman of large figure has the alternative of making herself appear less large in one of these colors equally fashionable with brown.

The length of a skirt, especially in this season of the varying lengths can be decided only by trying the dress on and determining whether the length is in proportion to her own height. Generally speaking, skirts are not so extremely long this spring as they were indicated to be last fall. Perpendicular lines tend to make the figure look tall and thin, and horizontal lines, either of the material or in the style of the garment tend to make one look wider.

Commercial patterns are bought by bust or hip measure. If the bust is large in proportion to the hips, it is wiser to buy by the bust measure since it is easier for amateur dressmakers to make a pattern smaller rather than larger. For a woman with a full bust and narrow shoulders a pattern should be chosen which is small enough to fit the shoulders and then allow fullness for the bust. Before patterns are used the instruction chart should be studied carefully to see which pieces are to be used and how to put them together. By doing this one removes the risk of cutting pieces which may not be needed.

Even if one has only three outfits a year, it is possible for her to appear well dressed in any of them, provided they have been chosen to suit her individual needs. The prime requisites are that they be perfect in taste, in fit, and in material.

Dainty Layette Set

LAYETTE SET NO. B1282-3-4-5 comes stamped on cream flannel with a cunning "bunny" design. Edges are hemstitched for crochet; seams are not sewn, and floss not included, hence the remarkably low price for these very attractive articles which may be purchased singly or as a group. Prices are: B1282 nightgown, 60 cents; B1283 Butterfly sacque, 40 cents; B1284 kimono, 65 cents; B1285 gertrude, 50 cents. Order from Embroidery Department, American Agriculturist, 10 North Cherry Street, Poughkeepsie, New York.

A Dashing Spanish Pair

SILHOUETTES are liked for boxes, baskets, portfolios or to frame for smart little pictures on the wall. Here is a romantic new pair, especially designed in the Spanish manner. The size is 6 by 8. They come printed in jet ink on a vellum stock paper. Number is M248 at 30 cents the pair. Best quality wood frames complete with glass are number 650 at \$2.25 per pair.

M248 Pair Printed Silhouettes.....30 cents.

We offer two other pairs of silhouettes in the same size and at the same price. A delightful Colonial Couple, No. M649, and An Elfin Pair, No. M249. Either pair are 30 cents.

Order from Embroidery Dept., American Agriculturist, 10 N. Cherry Street, Poughkeepsie, New York.

Aunt Janet's Corner

True Rest Defined by Goethe

When I hear friends say that the one thing above all else which they desire is rest—and at times I voice the same sentiment myself, I like to think of this little poem by Goethe, who is sometimes called the German Shakespeare.

Rest

"Rest is not quitting
The busy career;
Rest is the fitting
Of self to one's sphere.

'Tis the brook's motion,
Clear without strife;
Fleeting to ocean,
After its life.

'Tis loving and serving
The highest and best;
'Tis onward, unswerving,
And this is true rest."

—Goethe.

Fit Most Important

ALTHOUGH the quality of material is important from the point of view of service as well as the looks, it is even more important to have garments that fit. This is the advice given by the various clothing specialists.

One difficulty with ready-made garments is that they are made for the average figure and comparatively few women have an average figure. Therefore, it is necessary for the ready-made garments to be refitted in order to have the best possible effect.

If a woman finds it very difficult to buy ready-made clothes which fit, it

Attractive Paris Model

PEPLUM DRESS PATTERN NO. 3054 is charming for young girls because of its simple girlish lines. Printed silk, printed batiste, dotted swiss, or lawn would be well suited to the simple style of this design. The pattern cuts in sizes 8, 10, 12 and 14 years. Size 8 requires 2 3/4 yards of 39-inch material. PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps. Add 12c for one of the new Spring Catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

is far better for her to have her clothes made, but no matter whether she has clothes made, makes them herself, or needs to alter ready-made clothes, the points of a well-fitting garment are practically the same. They are as follows:

1. Size appears correct, no drawing or wrinkles.
2. Shoulder and underarm seams are correctly placed.
3. Sleeves hang without wrinkles or gathers at cap.
4. Skirt length is correct for figure and fashion.

Setting the Table Correctly

THERE are so many ways of setting tables that sometimes it is very confusing to know just what is the right way. Various hostesses of hotels and restaurants may develop certain

Youthful in Spirit

DRESS PATTERN NO. 2904 embodies a youthful spirit in its slender, sleeveless style. It is both charming and practical and is very easily made up. Plain or printed chiffon, lace, printed silk in gay Spring colors or some of the soft new cotton materials would be excellent for this design which cuts in size 14, 16, 18, 20 years, 36, 38 and 40-inches bust measure. Size 16 requires 4 1/2 yards of 39-inch material. PRICE 15c.

types of service peculiar to their own needs or whims but if one wishes to be sure that she is not violating any rules of etiquette, the following simple rules can be followed safely. These rules, among other helpful items about meal service, are given in a recent bulletin issued by the University of New Hampshire Extension Service. This bulletin is free to residents of that state and may be obtained by writing to the Extension Service which is located at Durham, N. H.

How to set the "cover" is outlined as follows:

1. Place silver one inch from and at

How many helpers are there in this picture?

If you've ever used Fels-Naptha, the answer to this is easy. You know there are *two* helpers in Fels-Naptha.

Two brisk, busy helpers working together! That's why Fels-Naptha brings you *extra* washing help. That's why Fels-Naptha is a real bargain in washing value. For Fels-Naptha is more than "just soap." It is good golden soap and *plenty* of dirt-loosening naphtha. Combined in one big bar, this eager team coaxes away the grimmest dirt—bringing you clean, fragrant clothes—without hard rubbing.

What's more, Fels-Naptha is gentle to your hands. It gets them out of water sooner. And every bar contains bland, soothing glycerine. Use Fels-Naptha in tub or machine. In

hot, lukewarm or cool water. For soaking or boiling. Try it, too, for pots and pans, for brightening wood-work, for cleaning all through the house. Ask your grocer for a few bars or the handy 10-bar carton today.

Special Offer—We'll be glad to send every user of laundry soap a sample bar of Fels-Naptha and a Fels-Naptha Chipper. Many women who chip Fels-Naptha into their washing machines, tubs or basins find this chipper handier than a knife. Use the chipper and Fels-Naptha to make fresh, golden soap chips (that contain plenty of naphtha!) just as you need them. Send only 4 cents in stamps to help cover postage, and we'll mail you the chipper and sample bar without further cost. Write today. Fels & Company, Phila., Pa. Dept. 1-4-25.

THE GOLDEN BAR WITH THE CLEAN NAPTHA ODOR

GLADIOLUS: 5 Giant Nymph bulbs, 1 Mother Machree bulblet and 100 Regal Lily seeds, included with 100 mixed bulbs or 10 each 5 varieties, labeled, \$1.25, prepaid. Price list.

C. A. WOOD, Box 14, BROOKLYNDALE, N. Y.

When Writing Advertisers, Be Sure to Mention American Agriculturist

right angles to the edge of the table. This prevents any unfortunate hitting of silver in taking your place at the table.

2. The knife is placed at the right of the plate with cutting edge inside or toward the plate.

3. The fork is placed at the left of the plate with the tines up.

4. At the right of the knife place the spoons in the order in which they are to be used; for example, the soup spoon which is used first should be on the extreme right.

5. The glass is placed at the right just above the knife.

6. Bread and butter plate goes to the tip of the fork and a little to the left. Butter spreader is laid across the edge of the plate with the handle toward the right.

7. The napkin, carefully folded, is laid at the left of the fork, one inch from the edge of the table with the open corner the lower one and next to the fork.

Ether Is Now Better

PEOPLE who go to the hospital for an operation are usually in a stage of lowered vitality before they reach the operating table. Ether, the most commonly used anæsthetic in hospitals, does not raise that vitality. Both the patient, anxious about his health, and the surgeon, solicitous of the welfare of the patient, want the best quality of ether available.

For several years the Food and Drug Administration, United States Department of Agriculture, has studied the quality of anæsthetic ether found in interstate commerce and has removed from the market ether that failed to meet the high standards required by the Federal food and drugs act. The chief difficulty encountered with anæ-

sthetic ether, says Dr. J. J. Durrett, chief of the administration's drug control office, is its tendency to develop aldehydes and peroxides. Pure anæsthetic ether, as defined by the United States Pharmacopœia, the standard for drugs under the food and drugs act, contains no peroxides and aldehydes.

Doctor Durrett says there has been a progressive improvement in the quality of anæsthetic ether marketed in this country in recent years. "In 1926," he declares, "Federal drug officials examined 470 cans of anaesthetic ether and found 162, or 34 per cent, not up to the standards set by the United States Pharmacopœia. Twenty-five percent of the cans examined in 1927 and 12 per cent of those examined in 1928 did not meet those standards; but in 1929 Government drug officials examined 3,464 cans of anæsthetic ether and found but 329, or 9 per cent, below U. S. P. standards."

Any ether entering into interstate commerce and failing to meet the legal standards as to quality and purity is subject to seizure under the Federal food and drugs act.

Do You Know That—

Cooked prunes, stuffed with a paste made of fine bread crumbs and butter, rolled in a strip of bacon fastened with a toothpick and sauteed, make a delicious accompaniment for meat.

* * *

A strip of white cloth six inches deep basted along the top of quilts and blankets prevents soil on the edge that comes in contact with the face.

Fresh stains of cod-liver oil may be removed easily by applying carbon tetrachloride and washing the garment in warm soapsuds.

The Story Thus Far

Jim Stuart sees a drifting canoe. He and Omar, his Indian guide, start out at considerable risk and rescue the person hanging on to it. They find it is a girl, the daughter of LeBlond, the head of the rival trading post. Omar's wife, Marthe, thoroughly disapproves of the knickers Aurore LeBlond is wearing.

Jim's next trouble is how to get her home. It was impossible to cross the lake; it is miles around and Jim feels that LeBlond will not be pleased to have his daughter stay at his rival's camp. Aurore seems to approve of Jim and there are indications that the approval is mutual.

In the course of the conversation it develops that Paul Paradis has been making disparaging remarks to Aurore about Jim.

* * *

"If you ask Black Jules Renault, your father's head voyageur, he might tell you that Paradis has a poor memory."

"Oh, when I saw you, today, I knew it. Paradis choke—you!" Her dark eyes lingered significantly on the wide shoulders, the corded column of his neck, the evident power in the brown hand which held his pipe. "But why waste time on other people when we are so interesting, ourselves?"

Her frankness was exhilarating. Imagine Mary Christie, he thought, so far forgetting her sense of the proprieties! Mary Christie with whom Stuart through the evening had been contrasting this raven-haired daughter of his rival. He could see Mary's blond eyebrows lift in scorn of the sheared hair and the whipcord jeans; of Aurore LeBlond's unembarrassed acceptance of the situation which made her his guest; of her complete candor.

"Lead on, Miss Aurore."

So she led on while he listened; amused, startled, now charmed, now puzzled by the direct thinking and amazing sophistication of this graduate of a convent school in Winnipeg. Of her mother she retained no clear memory, but her childhood years in her father's trading posts in the north she still recalled. Then came school and long intervals of months of silence from the man who was buried in the forests. Now, her education completed, she was living life to the full—tasting its thrills, exploring its by-ways, testing whatever of interest it had to give.

Two Thrills

"Little as this country can offer to a young woman curious of life," he observed, "it managed to provide you with one first-class thrill this afternoon."

"Two!" she corrected, her eyes suddenly grave with sincerity. "I was both drowned to-day—and saved!"

"You mean you were saved from drowning?"

She leaned toward him.

"No, I learned what it is to despair—and I learned what it means to have life given back to me." The eyes of the girl misted. In the intensity of her feeling her lower lip trembled. "You did that—gave me back my life! I did not thank you—made light of it. But I do thank you now!"

His face flushed; his grey eyes shifted uneasily under the poignancy of her dark gaze.

"It was easy enough—nothing," he

By
George Marsh

avoided. "We were lucky to see you—that's all."

She shook her head. "I saw how you had to fight to reach me." Then with a shrug she shed her gravity as one sheds a coat. "Now tell me about yourself, Mr. Jeem Stuart."

But Stuart did not dwell long on his early life in Hudson's Bay posts with the father who had died at God's Lake. Avoiding the girl's live interest in his three years with the Canadian Expeditionary Forces, he talked of the coming of the Hudson's Bay Company to the Lake of the Sand Beaches, and the building of Sunset House.

"Sunset House! Who gave it that name?" she asked.

"I plead guilty," he said. "We had such a succession of painted skies the week we finished the buildings. It seemed appropriate."

"Sunset House!" she repeated softly, as though to herself. "Lovely!"

"It sounds rather like a forlorn hope, doesn't it? I heard that your father thought it a great joke—said I knew what I was doing when I named it. It wouldn't last any longer than the setting sun."

"I don't think father knows you—very, well," she said with conviction.

Their talk was checked by a knock on the outside door.

The Search Begins

"What is it, Omar?" demanded the trader, with some irritation, for his evening with the daughter of his rival was proving most agreeable.

"Come outside; I show you something."

Leaving his guest, Stuart went out into the wind with the half-breed.

"Look!" And Omar pointed through the murk up the lake shore.

"I don't see anything," said the trader, impatiently.

"You wait . . . Dere! You see now?"

On a point, far up the shore, like fireflies in the dusk, a light flashed—then another.

"Dey hunt for her," added the half-breed, significantly.

"Yes; we must let them know she's here," agreed Stuart. "Take a lantern and see if you can signal them. I don't like to build a fire in this wind. It's pretty dry."

Returning to his quarters, Stuart announced: "They've crossed the lake to search the north shore for you. We can see their lights."

"Poor dad! He must be frantic," she said soberly; then her lip curled in a faint smile. "It's early, yet. Too bad to spoil our nice talk, isn't it?"

"It is," he agreed, "but think of your poor father."

"Oh, I do. I love him, you know. He's all I've got."

"Well, it'll be some time before Omar attracts their attention. All my men are up the lake with the freight canoes and my small Peterboro would fill tonight. Your father must have crossed in a big boat. There's nothing to do but wait for him."

"Then I can have another cigarette and we can talk until they come."

Was she strangely callous, he wondered, or totally without nerves, that she could calmly curl herself in a chair and smoke while her desperate father and his men hunted a rocky shore, white with surf, for her canoe and drowned body? Most women would have paced the clearing outside in a frenzy of excitement. With mingled amazement and curiosity he watched her remove the cigarette from her mouth with fingers which betrayed no

Aurore.

American Agriculturist, April 25, 1931 sign of nerves, and exhale a cloud of smoke. In all likelihood this vivid creature, who for a few hours had shared the hospitality of Sunset House, would never again cross his path. In the autumn she would return to the world outside, and, in the meantime, in spite of LeBlond's gratitude, the rivalry between the trading posts and the open hostility between the company servants would prevent Stuart's seeing her.

A Plot Against Paradis

"Let me see," she was saying, "I'm to be here six, seven weeks more. How am I to endure that Paradis all that time?"

"You might get your father to send him to Fort Hope," he suggested.

"That's a good idea! I'll do it." Then her black brows drew together as she added suggestively: "But you know, Mr. Jeem Stuart, I'm going to be lonely for someone to talk to."

"So am I, Miss Aurore LeBlond."

"Well, the answer is obvious. We'll talk to each other."

He shook his head. "I can't come to your father's place. There'd be war. You'll have to swamp again in the lake," he suggested with a grin.

"What? Wait that long? The wind might not blow for days."

The evident sincerity of the girl stirred his curiosity. "You've enjoyed your stay at Sunset House?"

"I've had a wonderful time! Between you and Marthe and Sarah, it's been a real party."

"Marthe and Sarah?"

"Oh, I don't want to spoil you,—"

Omar's dark face, following a call outside, appeared at the door.

"Dey build fire wen dey see my lantern. I tink a boat follow de shore, now."

Omar glanced darkly at the daughter of the man he hated, who returned his look with a cool indifference.

"Let's go and see," she suggested.

With the wash of the surf on the boulders of the shore and the drive of the wind through the neighboring forest in their ears, they stood on the beach, peering into the black night. Shortly, a light blinked through the murk.

"It's a lantern—in a canoe," explained Stuart. "They're coming for you."

He felt her hand on his arm—felt her wind-blown hair on his face as he bent to hear what she said. His blood stirred at her touch. Then the blanket, shielding Omar's lantern from the wind, dropped, lighting their shadowy figures.

"When will they get here?" she called through her cupped hands.

"Soon, now."

A Meeting Place

"Let's go back and talk until they come!"

So the two returned to the house while the sullen Omar waited on the beach.

"You know that little island—I think it's the one farthest to the east—with all the rocks and boulders on the shore?" she asked.

"Yes."

"You remember that split rock which stands partly in the water? Well, if you were to look behind that rock, some day, you might find a note from a very much bored person—that is, if you cared to go there and look."

Stuart thrilled at the thought of what her words implied. She wanted to see him again—wanted to talk to him. Then the hopelessness of the situation—the sheer recklessness of attempting to meet the daughter of LeBlond secretly—forced itself upon him. Omar would know—staunch old Omar—would know and would not understand. Then there was LeBlond. A pretty mess! Still—

"You mean you would paddle there—some day—alone?" Stuart asked, wondering what manner of girl this

(Continued on Page 18)

Farm News from New York

(Continued from Page 11)

talk on the benefits of health education.

A summary of the basketball games is given below: Malone defeated Gouverneur in the first elimination game by a 32-9 score, the game being hard fought in spite of the one-sided score. Superior defensive play and better team work by Malone featured.

The second afternoon game saw Madrid overwhelm Chateaugay by a 32-7 score. The individual playing of White and Willard of Madrid was the deciding feature of this game.

After supper the consolation game between the losers was played first, Gouverneur defeating Chateaugay 18-10 in a rough game.

The championship game turned out to be one sided, with Malone holding an 18-4 lead the first half. Legacy of Malone scored 25 points alone, while the high scoring Willard of Madrid was held to a single basket by Miller of the winners. The final score was 42 to 19 in favor of Malone.

The agricultural clubs of this section are located quite far apart but keep in close touch by rallies, judging contests, speaking contests and joint meetings. Thus a spirit of good-will and fellowship prevails.—Howard Lawrence, Franklin Academy, Malone, N. Y.

Farm Wages Lower

ACCORDING to the State Federal report of April, farm wages are lower in New York than in any spring since 1918. The reason for this is partly due to the low level of farm prices, and partly to the unemployment situation in general which has caused an increasingly great number of men to seek farm work. A decrease of approximately fifteen per cent below last April leaves farm wages on the average throughout the state as follows:

By the month, with board..\$38.75
By the month, without board 57.25
By the day, with board.... 2.35
By the day, without board.. 3.00

This is, of course, an average and there are wide variations in different parts of the state. Many workers receive both board and room also men hired by the month generally receive free house rent, milk, potatoes, and a chance for a garden. These additions to the cash wages make the real income of hired men much greater than the money alone would indicate. However, the labor picture as far as the farmer is concerned is much better than it has been for many years past. A few years ago, it was impossible to secure good help at any cost.

Many Orders for Trees

THE State Conservation Department has received orders for more than sixteen million trees to be planted this spring. Any individual or club wishing to make use of unused land may secure trees for reforestation purposes from the Conservation Department at a moderate cost. The prices charged are \$2 a thousand for two-year seedlings, \$4 a thousand for three-year transplants, and \$5 a thousand for four-year transplants. The species of trees available for reforestation include red, white, and Scotch pine, Norway and white spruce, white cedar, European larch, and black locust. Trees are being shipped out to all parts of the state collect.

Milk Situation Serious

THE latest report shows that the production of milk in New York State, is averaging 14 to 15 pounds per dairy over the same period last year. Combine this increase of production with a 5 per cent decrease in consumption and we have the predicament that the dairymen are now in.

Butter on the Chicago market is bringing 24 cents and in New York 26 cents, which means that while the price received for milk in the metropolitan area has not declined to any extent, the surplus must be disposed of at outside market prices with a resulting loss to the farmer. There is more surplus milk to be disposed of at this time than has

been the case for several years, since a large number of dairies freshened earlier than usual this spring.

Freestone Addresses Grangers

IN a meeting at East Fayette last Wednesday, Fred J. Freestone, Interlaken, New York, Master of the New York State Grange, stressed the importance of the Grange as a help to national agriculture. Important legislation brought about by the Grange included the 10 per cent tax on colored oleomargarine, and the placing of a tariff on buckwheat, corn, and beans was primarily the result of the Grange influence, according to Mr. Freestone.

Three hundred Grangers were present at the annual banquet which included the officers of the Pomona Grange and the 13 subordinate Granges in Seneca County.

Other speakers of the evening were: O. J. Anderson of Magee, master of Pomona Grange; Miss Elizabeth L. Arthur, Lowville, lecturer of the State Grange; Dana Waldron of Welcott, assistant steward of the state organization; Harry Patrick, deputy of Seneca County Pomona Grange; Kenneth Bird, master of Fayette Grange; and Seneca County Farm Bureau Manager, Daniel M. Dalrymple of Romulus.

A.A. On the Radio

WEAF—Each week day from 12:45 to 1:00 P. M. the New York State Department of Agriculture and Markets, cooperating with American Agriculturist, broadcasts market reports.

WGY—On Wednesdays during noon programs, usually at 12:25 P. M., Radio Station WGY broadcasts each week Eastern Farm News prepared by the Editorial Staff of A. A.

On Monday at 12:25 P. M., an editorial under the heading: "Editor Ed Looks at Life", prepared by Mr. Eastman, is broadcast.

National Broadcasting Co., Chicago—On Wednesdays each week during the Farm and Home Hour, from 12:30 to 1:00 P. M., a news item of interest to all agriculture, but which particularly concerns New York State agriculture, and which is prepared by the Editorial Staff of A. A., is broadcast.

WHAM—On Mondays, Wednesdays, and Fridays, Western New York News items prepared by Walter Hoose, Assistant Editor, are broadcast.

On Mondays and Saturdays an editorial is given, prepared by E. R. Eastman.

On Wednesdays a talk of particular interest to farm housewives is given by Aunt Janet of A. A.

Parental Discipline in Yellowstone

WHEN a mother bear spansks her cubs, it's just too bad, for the old girl just up and knocks the youngsters a couple of rods, according to Yellowstone National park rangers.

Moreover, mother bruin chastises her offsprings on the slightest provocation.

One day a Northern Pacific Railway party of farmer guests were feeding two cubs near Old Faithful. Nearby was the mother, but the tourists ignored her, favoring the cubs with nuts and candy.

Standing the proceedings as long as she could, the mother bear slowly arose from her haunches, approaching the cubs. She allowed the cubs to get just one more mouthful of goodies, then, using some very persuasive "bear talk," she told the cubs to "beat it."

However, bent on getting some more sweet meats, the cubs did not heed the parental warning, whereupon, mother bear swung a huge paw on one cub, then socked the other, turning both topsyturvy. Picking themselves up, the twins scampered up a tree, which, it seems, was just what their mother wanted them to do.

After the cubs stopped high up in the branches, the mother resumed her

sitting posture at the tree's trunk, and was she resentful at the treatment she had received from the visitors?

Well, she refused all offers of nuts and candies, and when a bear does that, there's something wrong.

Why not see the Yellowstone bears yourself? Write American Agriculturist for information about the A. A. tour to Yellowstone from August 1-10.

Storrs Laying Contest

The hens in the Storrs laying contest have now touched the 100,000 egg mark. It looks like an easy 200 eggs per hen before the race is run in that the birds have acquired half their quota in 45 per cent of the time.

In the twenty-third week the total production for all pens was 5,378 eggs or a yield of 76.8 per cent. This is 103 eggs more than last week's lay and is 43 better than that of the corresponding week last year. Australorps and Giants were the pacemakers with a production of better than 83 per cent.

Long Island Leads

West Neck Farm's pen of Rhode Island Reds from Huntington, L. I. repeated its performance of last week by coming through with 69 points to place at the top of the list. This team continues to stick in the scoring column principally through its ability to produce eggs that are 10 per cent oversize. These pullets are earning week after week a nice little bonus for their quality product.

The next three pens are all Leghorns and are owned by J. A. Hanson from Corvallis, Ore., Hollywood Poultry Farm from Woodinville, Wash., and

Tom Barron from Catforth, Eng. These three pens scored 67, 66, and 65 points respectively. A pen of Reds from Massachusetts followed with 64 points and two pens of Barred Rocks, one from Connecticut and the other from Nova Scotia, tied with a Vermont pen of Australorps. These three pens scored 63 points each.

Burn Brush Carefully

AT this time of year it is a custom of many farmers to burn brush and other refuse and in this connection a statement by Conservation Commissioner Henry Morgenthau, Jr. is especially applicable:

"Burning over fields to remove dead grass may or may not be a desirable agricultural practice," said the Commissioner. "It is certain, however, that it is a dangerous procedure. During the period of high winds and low humidities prevalent during the spring an extensive fire will probably escape from control and destroy valuable property. The exceptional drought during the past two years has resulted in reducing the water content of the soil to an alarming degree. This has a direct bearing on the danger from grass fires and has resulted this spring in more uncontrollable fires than usual."

Grange lecturers may secure a debate outline on the following subject by dropping a line to American Agriculturist, 461 Fourth Avenue, New York City, and enclosing 2c to cover cost of postage.

Resolved: That government crop reports are a distinct benefit to producers.

Here's Good News
that will save you money

Crow-Fez

TRADE MARK Reg.
The Guaranteed
Bird and Rodent Repeller
At New Low Prices

It is no longer necessary to pay fancy prices for an effective Crow repeller. Crow-Fez is guaranteed to protect your seed by ridding your fields of crows, blackbirds, larks, starlings, pheasants and other corn pulling birds and rodents. Crow-Fez aids and hastens germination and assists in preventing seed rot.

Crow-Fez is not a new, untried product. It has been used for years, with unvarying success by thousands of progressive farmers.

At the new low prices, no farmer, however small his acreage, can afford to plant without first treating his seed with Crow-Fez, to insure himself against seed losses and replanting cost and labor. Crow-Fez is endorsed by thousands. Read these testimonials, taken from our files:

"We have used Crow-Fez this past planting season in treating seed corn which was planted in fields badly infested by crows and pheasants. Results obtained were excellent. Crow-Fez does all that is claimed for it. We will treat all of our seed next year with Crow-Fez." —Utica State Hospital, Marcy, N.Y., Samuel Broughton, Farm Supt.

"It gives me great pleasure to recommend Crow-Fez to farmers who are pestered with seed destroying birds, with loss of seeds and valuable time. I used Crow-Fez last Spring with great satisfaction. It is simple to apply, and seed is ready to use at once. Last but not least, it did the work. A word to my farmer friends—try Crow-Fez and be convinced." —B.S.Green, Mgr., Masonic Home Farm, Utica, N. Y.

COMPARE THESE LOW CROW-FEZ PRICES—

½ pint . . . Treats 1 Bushel Seed . . . \$.60
1 pint . . . Treats 2 Bushels Seed . . . 1.00
1 quart . . . Treats 4 Bushels Seed . . . 1.50

Crow-Fez is Guaranteed

We guarantee Crow-Fez, when used according to directions, to repel birds and rodents effectively. We will refund the purchase price in the event of failure to prove as effective as any repellent made, regardless of price.

Classified Ads

A Place to Buy, Sell or Trade

CLASSIFIED ADS ARE INSERTED at the rate of 8 cents a word. The minimum charge per insertion is \$1. Count as one word each initial, abbreviation and house number, including name and address. Thus "J. B. Jones, 44 E. Main St., Mount Morris, N. Y." counts as eleven words. Advertising orders must reach our office at 461 Fourth Ave., New York City, not later than 12 days before the Saturday of publication date desired. Cancellation orders must reach us on the same schedule. Because of the low rate to subscribers and their friends, *cash or money order must accompany your order.* Orders for these columns must be accompanied by bank references.

WANTED TO BUY

WOOL WANTED: I specialize in Wool and Sheep Pelts. Write for prices. ALVAH A. CONOVER, Lebanon, N. J.

\$5 to \$500 EACH paid for old coins. Keep all old money. Many very valuable. Get posted. Send 10c for illustrated coin value book. 4x6. Guaranteed cash price. COIN EXCHANGE, Box 25, LeRoy, N. Y.

WANTED—Empty feed bags. HOFFMAN BROS., BAG CO., 39 Gorham St., Rochester, N. Y.

USED SINGLE or double bottom Ferguson plow for Fordson. MacDONALD BROS., R. 1, Newburgh, N. Y.

CANDEE COLONY BROODERS. State price, age, condition. LEO GUYETT, Oswego, N. Y.

COD LIVER OIL

PURE GOLDEN COD Liver oil for poultry animal feeding. Richest known anti-rachitic and growth promoting food. Five gallons \$6.75; 10 gallons \$13 at New York. Special prices in barrels. CONE IMPORT COMPANY, 624 Kent Avenue, Brooklyn, N. Y.

BEES AND HONEY

HONEY—OUR FINEST White Clover 60 lb. can \$5.25; 120 lbs. \$10. J. G. BURTIS, Marietta, N. Y.

HONEY—Clover-basswood, rich and delicious, 5-lb. pail \$1.00; 10-lb. pail \$1.75, postpaid to fourth zone. Price of 120-lb. case on request. GELSER BROS., Dalton, N. Y.

MORE HONEY WAS SOLD last year by beekeepers than ever before—through roadside markets, to their neighbors and grocers. Good business when other business wasn't good. It furnished "pocket money" to thousands on farms and small-home lots. Do you want to earn some "extra" money this year, either by beginning beekeeping or keeping your bees better? We can help you to certain success. Start now building towards some regular income. Write for our free booklet, "Bees for Pleasure and Profit." If you want to transfer bees to better hives, write for free illustrated folder on "Transferring Bees." Address A. I. ROOT COMPANY, 233 Liberty St., Medina, Ohio.

FARMS FOR SALE

Under Frozen Stars

(Continued from Page 16)

was who so lightly put her trust in a stranger.

"Perhaps I should so far forget myself," she replied, archly, "if I found an answer to my note."

"Try me!" he urged, reckless of the outcome in his desire to see again this girl so vividly alive, so baffling to his curiosity.

Her dark eyes flashed the challenge: "You will be bored, too?"

"How can I help being bored—after to-day?"

"You're improving." A red lip curled in satisfaction. "A little more training and you'll be—"

The yelping of dogs and the sound

of voices outside, above the beat of the wind, stopped her.

The Rescue Party Arrives

"Here they are! He's coming—dear old dad!"

Stuart stepped to the door to meet the man who had, the winter before, down on the railroad at Wabigoon, boasted openly that two years would see the end of Sunset House.

"Aurore, my girl? She is here?" The agitated LeBlond, delirious with joy at the news given him at the shore by Omar, pushed past the man who opened the door. "Aurore, my child! Ma chérie!"

"Dad! Mon pauvre pere! Good old dad!"

As the trader took his daughter in his arms, in a swift glance Jim Stuart's curious eyes measured the rival he had never seen. LeBlond was little taller than the girl who spoke rapidly in French as he stroked her black hair; but the set of the iron-grey head on the square shoulders—the bold nose and chin of the dark profile suggested the force and daring which his reputation had given him. Closing the door behind him, Stuart remained outside with the two men who had followed LeBlond to the house. In the blackness the Hudson's Bay man could not see the faces of the blurred shapes beside him. Then the door opened and LeBlond called them inside.

HANDY ANDY Says "Here's How"

To Breed High Producing Poultry

By Ray Inman

HERE'S A SIMPLE OUTLINE OF EASY LINEBREEDING:

1. Foundation males must have a pedigree showing at least 3 generations of high egg production.

2. The colony eggs must be marked and kept separate.

3. The chicks should be toe-punched for later identification.

4. A simple method of line breeding is to mate the son of the foundation male to the granddaughters of the foundation male.

*Bulletin 258, Iowa State College of Agriculture.

The Service Bureau

A Department Devoted to the Interests, Welfare
and Protection of A. A. Readers

What Would You Do ?

Here is a proposition I am going to make to you, whereby we can clean up and be friends and you will get your premium and we will get your eggs. I did this with another large shipper and it has worked out fine. I can see now where we will liquidate our indebtedness in New York if one of the banks starts up. Here is the proposition—Ship us your next lot of eggs this week, 5 or 6 cases. Upon receipt of that shipment we will mail you back a check for one of your old shipments and upon receipt of your following shipment we will send you another check and then if you continue shipping at the end of 10 days we will catch up one of the payments that are behind and then every 10 days we will make good until we are even. In this way you will be getting your premium, we will be getting eggs and all will be well.

I made good thousands of dollars last year when one of our big customers busted and left us flat for a large sum. We are carrying so many notes for customers on account of a busted bank in New York and which notes we expected to be paid this past week, that it has hurt us. However, I see that one of the banks will open shortly.

If this proposition meets with your approval please let me hear from you.

THE above letter was sent us by a subscriber. It came to him from a receiver of eggs in New York City who already owed our subscriber a considerable sum of money. We are printing the letter to show the temptation a poultryman is under when he ships to receivers and does not get his pay. It sounds fine and our subscriber is tempted to continue to ship. He asked our advice which is that so far as we have observed in years of experience, conducting the Service Bureau, there is no use in sending good money after bad.

The receiver who wrote the above letter is not licensed and bonded and is not given any rating by our market credit guide. As we understand it he is merely a small groceryman who is buying eggs direct from producers. He may be entirely honest, yet if he fails in business shippers have absolutely no protection. Private investigations which we have made show that he has very limited credit or financial responsibility.

Had our subscriber written us before shipping to this man we most certain-

ly would not have recommended him. We take this occasion to remind our subscribers again that they are inviting trouble when they ship to egg buyers, or for that matter buyers of any other kind of produce, without first checking their reliability both financially and morally. We will be glad to give a report on any shipper if subscribers will just ask us for it.

No Forwarding Address

Over a year ago I shipped two cases of eggs to Benjamin Hartman, 185 Duane St., New York. I received no returns and wrote him to that effect. Previous to that time I had shipped eggs to him for about 8 months and he has always been very prompt in making returns. The last signed check he sent me was returned from the bank marked, "Account closed."

WE have written to Mr. Hartman at the address given by the subscriber but have received no reply to our letters and have been unable to locate him. Mr. Hartman is not listed in our market and credit guide and had our subscriber written us before he shipped eggs to him we could at least have given him that information. As it is now, there seems to be little chance that the money will ever be obtained on this shipment of eggs.

Do Not Waste Money on Quack Remedies

THOUSANDS of dollars are wasted every year on quack remedies. During the last twenty-four years, the Federal food and drug administration has started more than seventy court actions against forty so-called cancer cures. Dr. Durett, chief of the Drug control of the Federal Department, points out that there is no scientific or medical evidence to show that there is any drug or combination of drugs to cure cancer.

An order was recently issued against the Flowering Herb Company of Chicago for the sale of a preparation called "Flower Herb" advertised to be a cure for diabetes.

A Federal Trade Commission recent-

ly ordered Doctor Rodney Madison, president of the Doctor Rodney Madison laboratories of Indianapolis, to discontinue advertising that a so-called magnetic device "Vitrona" would cure or help cure diseases of any kind.

The advice of the American Agriculturists' Service Bureau which has been so often repeated, is that our subscribers who are ill should consult a reputable physician and follow his advice.

Facts About Dog Licenses

WE often get letters from subscribers on questions concerning dog licenses. The New York State law says that no person may own a dog over six months old unless a license is provided. A license is required even though a dog may be kept tied up. The license is taken out for the calendar year and fees, payable to the town or

Proud of Service Bureau Sign

I AM glad to inform you that I received a check for \$9.59 from as payment on a case of eggs.

I feel very thankful to your Service Bureau for the prompt and valuable action you rendered to make this company settle this matter and this certainly taught them a lesson to pay more attention mailing returns to egg shippers in the future.

I assure you it gives me great pleasure to see the good work you do in your paper through its various departments as well for information and protection and I'm proud to have your "Service Bureau" sign above my garage door.

city clerk, are \$2.25 for each male dog or spayed female and \$5.25 for each unspayed female dog.

The clerk at the time of issuing the license delivers a tag to the owner of the dog. A dog owner can not collect damages if anyone kills a dog which does not wear a license, or for a dog who has a license but is not wearing a tag. Where a dog is sold, the license can be transferred by a tag fee of twenty-five cents, payable to the town and city clerk.

Prevention Better Than Cure

PREVENTION is always better than cure, and we are glad to note that the number of inquiries with regard to the reliability of companies received in the month of March this year is almost double that in the month of March, 1930.

The following request from one of our readers may be of interest:

"I would like to give a good home and clothes to a girl and boy who are finished with school and would like to work on a farm. The girl would learn good housekeeping helping me and the boy would have little jobs to do around the farm. We have men to do the hard work. Stores, church, railroad station, etc. are only about a minute away from us in a car."

If any of our boys and girls would be interested in communicating with Mrs. H. S. we will be more than glad to forward all letters sent to the Service Bureau, American Agriculturist, 461 Fourth Avenue, New York City.

Sign Your Letters

We have a letter from one of our readers, Mr. Wilfred Jock who fails to give his address. Mr. Jock requests the address of the Firestone Tire and Rubber Company and we are taking this method of advising him that it is Akron, Ohio.

This is another instance of numerous inquiries which come to us from subscribers who fail to give us either their full name or address. We will be unable to answer such inquiries because space will not allow our publishing the answers to all of them.

FARMEX FACTS

In quarrying the stone for King Solomon's temple which was begun 983 B. C., channels were cut with crude picks to mark the dimensions of the blocks. Holes were made along the channels and wedges of drywood were driven into the holes. Water was then poured on the wedges. The wood swelled and broke out the stone blocks.

FARMEX EXPLOSIVES

Thus the force of expansion, the secret of the tremendous power of explosives—was employed for useful work many centuries before high explosives were developed. Today vast quantities of dynamite are used annually for quarrying, likewise large quantities of Farmex are employed for breaking boulders, stumping and ditching. If interested in explosives for such work, write:

Some Questions About Applying Fertilizers

(Continued from Page 3)

usually made. One test showed practically no injury from the use of superphosphate at the rate of 300 pounds per acre when it was applied experimentally direct to the seeds in the row on all common farm crops.

* * *

Why is a quickly available nitrogen carrier so often emphasized when applying fertilizer to early crops?

Early in the spring there is little available nitrogen in the soil for the growth of the crop. As the weather becomes warm this nitrogen is made available. Consequently, fertilizer containing a soluble nitrogen compound will give the crop a start while the temperature is still relatively low. In fact, giving the crop a good start is one of the advantages of using commercial fertilizer and to do this it is, of course, necessary to have the fertilizer fairly close to the seed so that the plant can get it almost as soon as it starts growth. This early growth is important in sections where the growing season is short and with products where the early crop is much more valuable than it is later in the season.

* * *

Where fertilizer is applied in the row, will it give the best results above, below, or at each side of the seeds?

Experiments seem to indicate that fertilizer either above the seed or directly below it will give about as much injury as it will in direct contact with the seed. Some experiments on potatoes showed best results where the fertilizer was put in a narrow band at each side and slightly below the seed. In this connection it is interesting to know that many manufacturers of machinery have spent quite a bit of time and money in designing and manufacturing machines which will apply the fertilizer in this manner.

* * *

Is it advisable to apply lime and fertilizer at the same time?

Experts usually advise against this because the lime has a tendency to make the phosphoric acid less available. Probably the best way is to broadcast the lime and harrow it into the soil a week or ten days before the fertilizer is applied.

* * *

Where a heavy application of fertilizer is advisable, what is the best method of applying it?

This will depend on the crop. With potatoes where as much as a ton per acre is sometimes added, some growers broadcast half and apply the remainder when the crop is planted. With a crop such as cucumbers, part can be broadcast, part put in at the time of planting, and the remainder used as a side dressing just at the proper time. It is only, of course, where a heavy application is made that there need be any fear of injury of crop, assuming that it is applied properly.

* * *

Is there more danger of injury to seed with the newer concentrated forms of fertilizer than there were with the older less concentrated forms?

Experiments show that where equal amounts of plant food are applied, there is no more danger of injury by using concentrated fertilizer than there is where the less concentrated forms are used. The concentrated fertilizers are, of course, highly soluble and large amounts of them placed in direct contact with the seed would be injurious to most crops.

* * *

Under what conditions is side dressing of cultivated crops advisable? I mean putting fertilizer along the row after the crop is partly grown.

In general, of course, you might say this is advisable whenever it can be done at a profit. More specifically where a valuable cultivated crop is grown it has been shown that faster growth can be secured by applying part of the nitrogen along the row some time during the growing period. The time sug-

ONLY THE MAYTAG

Gives You Such Farm Washing Service as this

MAYTAG NOW MAKES A MULTI-MOTOR WASHER MODEL "G" (NOT ILLUSTRATED) THAT SELLS FOR \$130 LESS THAN

FREE FOR A WEEK'S WASHING

Write or phone the nearest Maytag dealer for a trial home washing. If the Maytag doesn't sell itself, don't keep it. Divided payments you'll never miss.

For homes with electric current, Maytag washers are available with electric motor.

Changes washday to a pleasant hour or two.

One-piece, cast-aluminum tub, with hinged lid. Holds four gallons more than ordinary washers—built for life-time service.

Counter-sunk Gyrtator, an original Maytag method of washing clothes clean without hand-rubbing or boiling—saves the clothes.

Roller Water Remover, with enclosed, self-reversing drain and oversize divided rolls. Wrings everything evenly dry and spares the buttons.

Enclosed Drive—quiet now, and quiet years from now. No oiling, no adjustment necessary.

GASOLINE OR ELECTRIC POWER

For homes without electric current, the Maytag is equipped with the gasoline Multi-Motor—built by Maytag exclusively for the Maytag—the simplest, most compact washer engine built.

CHURN AND MEAT GRINDER ATTACHMENTS

Churn your butter and grind your meat, nuts, fruits with these popular Maytag time and labor-saving attachments. Reasonably priced as extra equipment.

THE Maytag

THE WORLD'S GREATEST WASHER VALUE BY EVERY TEST

WASHER · TABLE IRONER

gested for different fruits and vegetables is: cabbage—about heading time; tomatoes, melons, cucumbers, and squashes—after fruit is set; rhubarb and asparagus—in the early spring just as growth starts; corn—when stalks are 2½ to 4 feet high.

The reason back of side dressing is that the nitrogen which is readily available, is likely to be either used or leached out by the time the crop gets a good start. Then the addition of more food which is quickly available will push the crop along rapidly.

Readers who have buildings with galvanized metal roofs may be interested in writing to the Trade Research Division of the National Association Flat Rolled Steel Manufacturers, 511 Terminal Tower Building, Cleveland, Ohio, for a little pamphlet "How to Ground a Galvanized Roof Against Lightning."

Poultry Equipment and Supplies

WE frequently get letters from subscribers who ask where they can buy certain equipment or supplies. It is good business when you are in the market to get all the information possible before buying. Consequently, we have made arrangements to forward to you, information, catalogues and prices on such equipment or supplies as you may need.

In taking advantage of this service you are under no obligation either to us or to the manufacturer. Just clip this coupon, mark the items in which you are interested and mail to us.

SHRINES OF AMERICA

Gettysburg Battle Field

SUMMER, 1863. Lee's army, at the peak of its success, pushes north the battle line. The Army of the Potomac, driven from Virginia, makes frantic defensive maneuvers, an anxious eye on Washington. They meet at Gettysburg, Pennsylvania. Three days of terrific combat—Cemetery Hill, Little Round Top, Devil's Den, the Peach Orchard, Culp's Hill, Picket's charge and the gray tide is stemmed, washed back into Virginia. The forces at Gettysburg whipped powder, shot, shell, gallantry, blood and fury into the most potent draught America has ever offered the Gods of War. But the Union is preserved. Left, Lee's headquarters at Gettysburg. Below, Devil's Den, a bloody point in the battle.

A Ford Truck

will do your hauling at a very low cost per mile

AT PLANTING-TIME, a Ford truck will bring all your supplies out from town at low cost. With its 40-horse-power engine and 4-speed transmission, it has a wide range of speed and power — ample speed to save time on the smooth highway, and abundant power to haul a full load of seed, fertilizer or machinery through steep, rough backroads or down muddy lanes out into the fields.

When the time comes to market your products, you can profit again by Ford economy. Many farmers find that it pays to haul direct to central markets, because they can sell at better prices.

With the Ford, this added distance is covered at small extra cost, while the speed and alert performance of the Ford shorten the time of the trip.

The economy of Ford trucks begins with their low first cost. After months and years of constant use, and thousands of miles of service, the operating and maintenance economy of the Ford becomes strikingly apparent.

This is because the Ford is easy and economical to keep in repair. Its chassis is of simple and rugged design, contributing to reliability and long life, and reducing the necessity

for frequent servicing. Replacement parts are low in cost, and service from Ford dealers is prompt and efficient.

The Ford 11½-ton truck chassis is available with either 131½-inch or 157-inch wheelbase. It can be equipped with stake-sides and cattle-racks, for use on the standard platform body. There is a choice of open or closed cabs, single or dual rear wheels, and high or low rear-axle gear-ratios. You may purchase a Ford truck on convenient, economical terms through the Authorized Ford Finance Plans of the Universal Credit Company.

What Readers Want to Know

Some Timely Questions About Garden and Field Crops

Why do you recommend the use of fertilizer this year when prices are cheap and farmers must keep down costs to the lowest possible point in order to show any profit?

THAT is just why we recommend the use of fertilizer. It is one thing to keep production costs down per acre

search Farm and with certain vegetables an increase in the crop resulted even though the seeds were not known to be affected with any disease.

The effect was particularly noticeable on early plantings of cabbage, radishes, peas, corn, cucumbers, tomatoes, and string beans. It is believed that the beneficial effects resulted from the pro-

crop. The two diseases for which seed potatoes are ordinarily treated are common scab and black scurf or rhizoctonia. The two disinfecting agents recommended for such treatment are formalin and corrosive sublimate (mercuric chloride or bichloride of mercury). Formalin is as effective against the common scab as corrosive sublimate, but it does not give as good results in the destruction of the black-scurf fungus. When the latter is present on the tubers, corrosive sublimate should be used.

The exact method of treatment is contained in a circular put out by your state college and it may be obtained free of charge, or we will be very glad to get it for you.

Depth to Plant Potatoes

Is there any advantage in planting potatoes deep?

The best depth to plant will depend to some extent on the soil. Most recommendations advise three inches deep for heavy land and four inches for lighter soil. Shallow planting frequently results in a low moisture supply at the time when the plant should be getting a good start, then later in the season there seems to be more of a tendency for potatoes to develop nearer the surface and get sunburned.

Mulch Paper for the Garden

What would you advise regarding the use of mulch paper in the garden?

The question of mulch paper is not a simple one and broad statements are not safe. Results will vary with the crop, type of soil, and weather during

Most crops can be planted conveniently in the space left between the strips. For tomatoes or other hill plants the soil can be completely covered and the planting done through holes made in the paper.

Inoculating Legumes

Does it pay to inoculate legumes under average farm conditions and where can the inoculant be secured?

It has been shown that in the case of alfalfa, sweet clover, peas or other legumes that are being grown on the land for the first time, that inoculation is really necessary.

Cultures for the inoculation may be secured through your Farm Bureau office or a commercial culture may be obtained from your local dealer. In applying the inoculant to the seed, the general practice is to mix a small quantity of the seed thoroughly with the inoculating material then mix this treated seed thoroughly with the entire amount to be treated. Increased returns from legumes will more than pay for the small cost of inoculating.

Applying Lime

According to the soil test, our field needs about two tons of limestone to the acre for alfalfa. Should we apply it on next spring with the alfalfa or should we put on some this year?

According to Professor A. F. Gustafson, of the New York State College of Agriculture, one-half of the lime necessary, should be applied to a cultivated crop the year previous to seeding, where the amount required is better than one ton to the acre.

Soy Beans for Silage

Do you believe that it pays a dairyman to plant soy beans with silage corn?

There is no question but that soy beans, assuming that you can get a crop, do add to the protein content of silage. However, it has been our experience that you cannot grow two crops on the same land with much success. We believe if you will plan to mix soy beans in your silage that you will get better results if you raise the two crops separately and then mix at the time they are put into the silo.

Crows Damage Corn

Can damage to corn from crows be prevented by treating seed? Can treated seed be used in the corn planter?

Many subscribers report success by using coal tar or a commercial crow repellent. Directions are to heat the grain first by dipping it in warm water, then use a tablespoonful of tar or crow repellent for a half bushel of grain and stir the corn until there is some tar on every seed. When this is dry the seed can be used in the planter without any trouble.

The number of eyes on each seed piece is not so important as it is to have seed potatoes cut into good chunky pieces like these.

and another thing to keep them down per unit of the crop produced. Fertilizer prices are still low when compared to crop prices and the right use of fertilizer will enable you to produce potatoes for less cost per bushel and silage corn for less cost per ton. The same applies to all farm crops.

Lime for the Garden

What vegetables in the garden need lime especially, and are there any vegetables where it would be inadvisable to use lime?

Most of the common garden plants such as beans, corn, potatoes, parsley, radishes, watermelon, sweet potato, and tomato are very tolerant to acid soil conditions and carrots, peas, pumpkins, rhubarb, and squash are not sensitive to the lack of lime.

However, in growing beets, asparagus, celery, lettuce, onions, parsnips, pepper, salsify, and spinach it is essential that there be plenty of lime in the soil.

Transplanting Tomatoes

When the tomatoes are transplanted in the garden, should they be put in the same depth as they were in the flats or should they be put in deeper?

Always set tomatoes in deeply. Roots will then develop along the stem and you will get a much faster growing plant. We also suggest that you wet the roots thoroughly before you transplant the tomatoes as they can then be moved with less injury to the roots. If it is windy it will pay you to protect the plants for a day or two, perhaps by covering each one with an old peach basket.

Use Vigorous Plants

We are planning to set out a new strawberry patch. Will we get good results from taking the plants from last year's bed or should we buy our plants?

Assuming that these plants were set out last spring you will get good results if you will take only vigorous healthy plants. Discard all those that seem small and weak or whose root system is not well developed. If you want to try a different variety or if your present bed is not vigorous you will doubtless get better results from buying plants from some good reliable nursery.

Treating Vegetable Seeds

Is it advisable to treat vegetable seeds with the new organic mercury preparations?

A year ago some experiments were done on the Long Island Vegetable Re-

section of seeds against decay organisms.

Change in Spacing Suggested

The New Jersey Experiment Station suggests the spacing of tomatoes 3 feet by 5 feet. This allows setting 2,905 plants to the acre, 182 more than can be put out by spacing 4 feet by 4 feet

These short course students at the New Jersey State College are learning the best methods of inoculating legumes.

which has been the common practice in the past.

They also suggest a change in the spacing of cucumbers and cantaloupes which are commonly planted in hills 3x5 feet or 5x5 feet. Their suggestion is to put rows 6 feet apart and then to thin the plants until they are 12 to 15 inches apart in the row. This makes it easier to apply fertilizer and reduces hand labor to a minimum.

One Eye Enough

Is it advisable to have more than one eye on the seed piece when cutting seed potatoes?

The Ohio Experiment Station claims that usually only one eye produces sprouts no matter how many eyes there may be on the seed piece and that, therefore, one healthy eye is all that is needed.

What is more important is to have a fairly good sized seed piece which will serve as a food supply for the growth of the plant until the roots get established.

Treating Seed Potatoes

Would you advise treating seed potatoes and what is the best method?

It is impossible to produce high-grade seed potatoes if the seed harbors disease organisms capable of infecting the

the growing season. The paper comes in strips 18x36 inches wide and is laid down at the time of planting the crop.

The paper eliminates hoeing, and is also said to increase the temperature of the soil, thus enabling the grower to produce earlier vegetables.

The paper must be weighted down in some way by soil, stones, or by pegs.

A tomato field showing the effect of fertilizer. The plants in the foreground received no fertilizer, while those growing luxuriantly in the background received a heavy application of commercial fertilizer. Which part of the field will produce tomatoes at the lowest cost per ton?

Publisher and Editor Go A'Flying

ONE fine, sunshiny spring day recently Mr. Morgenthau and I, having finished our work at Albany a little early, motored out to the Albany Airport and boarded an airplane for New York. It is a hundred and fifty miles from Albany to the New York City airport in Newark, New Jersey, and it requires three hours to make the journey by the New York Central's fastest "crack" passenger trains. We covered the distance by plane in about an hour and fifteen minutes. The airplane followed closely the course of the Hudson River. We were five thousand feet, or nearly a mile high, and the great river below us seemed but a sizeable creek.

In 1609, Captain Henry Hudson, in the employ of the Dutch East India Company, sailed into the mouth of the Hudson and thought he had found at last that magic passage through the Americas to the East Indies. As we flew over this river I thought of Hudson and of what his thoughts would be could he return and sit with me for the little more than an hour that it took us to cover the journey which he required many days to make.

Sailing up the river, Hudson passed the beautiful Palisades, the Highlands, and the Catskills, and did not turn back until forced to do so by the shallow water near Albany. Hudson was delighted with the country, as he might well be. "It is as beautiful a land," said he, "as the foot of man ever trod upon." Everyone who has ever taken the journey, either by boat or train, or especially by airplane, would certainly agree. The ever-changing colors of the water and the clouds and blue sky over the mountains are scenery of which Americans may well be proud.

What an indescribable feeling it is to ride in an automobile across the Bear Mountain Bridge and along the great Bear Mountain Highway with its sheer walls pitching straight to the Hudson on one side and rearing perpendicularly in the air on the other, and then to get in an airplane and be able to look right over the top of that mountain and several other ranges, fading away into the haze of the distant horizon!

Since taking several long airplane trips in the last few years, I have often remarked that every living person should have the experience, at least once, of riding in an airplane; particularly should they do this if they are inclined to be conceited, for nothing that one can do will give one a better perspective of the true and relative importance of things than looking down upon this little earth from a mile into the air. How insignificant appear all the small goings and comings of man. Our tallest buildings are but ant-hills, our cities are

but scattered and disorderly blots upon the great landscape. The modern world puts too much importance in cities. Go up in an airplane and see how small the cities are in comparison with the great countryside with its mountains, forests, plains, and the cultivated fields.

Some time I believe mankind is going to solve many of its economic problems, most of which are caused by too many people trying to live in the same place—that is, in cities, by de-centralizing into the rural districts again, and rapid communication and such devices as the airplane, which will soon become more practical, will aid this de-centralization. Lack of efficient distribution is the chief reason why we are starving and going without in the midst of a great surplus. De-centralization may help to solve this problem. One realizes this as he looks down from the sky and thinks of the changes that have been brought about in the world in the comparatively brief time since Henry Hudson first sailed the river that bears his name.

New School Law Will Save Taxes

THE most important school law passed by the New York State Legislature this year was sponsored by Assemblyman Irving Rice, of Cortland County, Chairman of the Committee of Education in the Assembly, and changes the fiscal school year from August 1st to July 1st. This should have the attention of all trustees and boards of education. Its importance lies in the fact that State aid moneys will now be received by the districts a month earlier than they were under the old law, which means that thousands of districts will be saved from the expense and trouble of borrowing money to pay necessary expenses while waiting for State money to arrive.

The new law will save local taxpayers thousands of dollars and school officials much inconvenience. Assemblyman Rice, Senator J. Griswold Webb, Chairman of the Committee on Education in the Senate, and their fellow legislators are to be congratulated for this helpful and constructive piece of school legislation.

Fair Gambling Bill Vetoed

GOVERNOR ROOSEVELT is to be congratulated for vetoing a bill which, if it had become a law, would have permitted gambling under certain conditions at fairs. The bill would have struck out from the present law against the use of gambling devices the prohibition against wheels of fortune, and would have excepted from the general prohibition of gambling devices "the operation of uncontrolled free-running vertical wheels and electric flashers."

How such a bill ever came to pass both the Houses of Legislature is a mystery. For many years, leading farm organizations and others have been working to clean up the fairs. Every country resident will remember the time when gambling and indecent side-shows ran openly and brazenly at every country fair.

We did not hear about this bill until after it was passed, but promptly submitted an argument against it to the Governor and asked for its veto.

As a matter of fact, some fair officials seem to be more interested in selling concessions to make money than in keeping up the high standards of their exhibits and entertainment. The time is coming when the only justification which the State will have for giving local fairs large sums of premium money will be on the basis of the fairs which receive this money being kept absolutely on an agricultural basis. We are informed that as much money is spent by the State to maintain its fairs as is used by the entire agricultural extension movement of the State College and Experiment Stations. We do not believe that the people get the benefit of the State taxes spent for many fairs under the present system.

Another angle on the passage of this gambling bill at Albany was the fact that there was no opposition from the church organizations, or even from farm organizations. A friend, in commenting on this situation, said rather sadly that there

was a time when the churches had a good representation at Albany during the sessions of the Legislature to work with the leaders to safeguard the moral interests of the people of the State, but that unfortunately, for some reason or other, the churches seem to have become indifferent to their legislative responsibilities.

Two Farm Leaders Pass On

NEW YORK State has lost recently two outstanding leaders of rural life, F. H. Thomson, of Holland Patent, and R. W. Quackenbush, formerly of Cornwall-on-the-Hudson.

Mr. Thomson's services to farmers and to the cooperative movement are too well known to need detailed comment. He was a pioneer in the dairy marketing cooperative work. It was our privilege to work by his side for years, and never have we known a man with more perseverance, with more determination to set a goal and then to work for it against all odds than F. H. Thomson. His efforts to improve the condition of the dairy farmer through cooperation go back to the Five State Association in which he was an active leader. In both the League milk strikes, of 1916 and 1919, his common sense, his steady courage, and his unfailing good nature made him a Rock of Gibraltar in the League offices in those worrying times. As a citizen, as a gentleman, and as a friend, F. H. Thomson was unsurpassed.

Mr. Quackenbush was a leader in a different kind of service to farmers. For many years he was agricultural agent of the Ontario and Western Railroad, later doing similar work, until comparatively recently, for the New York Central. Mr. Quackenbush was outstanding in his convictions that while organization and the government might help, yet it was more up to the farmer himself whether he succeeded or not. Thousands of farmers up and down the country, served by the railroads for which he worked, will miss his familiar figure and quiet, kindly advice.

Fire Is a Bad Master

COMMISSIONER Henry Morgenthau, Jr., of the Department of Conservation, is sending out daily fire prevention warnings in an effort to stop the serious forest fire hazard which now confronts the State because of the dry weather. On Sunday, April 20th, there were reports of approximately a hundred fires burning in the forests of the State. These fires invariably resulted from carelessness on the part of automobile parties, fishermen, hikers, or property owners burning refuse material around buildings.

The State is spending large sums of money to build beautiful recreational parks for its people and to start great areas of reforested lands. It would seem that the least the people who use these parks and forests could do is to help preserve them.

Be careful where you start a fire; be sure you always have it under control; and when you leave it, put it out.

Eastman's Chestnut

HOW it helps, when we get hurt or make a mistake, if we can just blame somebody else—anything for an alibi.

A friend sends me a good story about an elderly farmer with a rather testy disposition, who had the habit of relieving his feelings when in a tight place by doggerel rhymes, made up on the spur of the moment.

This old fellow came in from milking one evening carrying two full pails of milk. His wife had just finished mopping the kitchen, and when he stepped on the wet floor, down he went, spilling the milk all over himself and the floor. For a moment he lay there a bit dazed, and then straightening up, he glowered at his wife, and said,

"There I go, pell-mell,
Two pails of milk all shot to h—;
Ain't I told you times before
Not to mop this gol-darn floor?"

Notes from the Publisher's Farm

AFTER being appointed Conservation Commissioner I realized that I would not be able to give my farm as much personal attention for the next two years as I have in the past. For a short period I considered selling all my cows as I felt that dairying was one of the farm operations which needed more personal attention than possibly any other. However, the great attachment which my family and I have for the cows which we have bred, raised and developed since 1916 made me hesitate and reconsider.

HENRY MORGENTHAU JR.,

I called in my herdsman, Mr. Arthur Hoose, who has been with me for the last three years, and I put up the proposition to him of taking over the farm and dairy on shares. Mr. Hoose was immediately interested and gave the matter careful consideration. He is very fortunate in having a brother who is cashier of a country bank to advise him. We both thought the matter over for several days and decided that we would draw

up a contract whereby Mr. Hoose would run the farm for one year on shares. I asked Dr. Carl Ladd what the usual practise was and he gave me a formula which has worked out successfully in many cases. The basis on which Mr. Hoose has leased the farm—exclusive of the orchard—for one year, is as follows:

I turned over to him the use of the farm lands and buildings, all of the cattle, and I pay all the taxes, insurance, repairs on buildings, alfalfa, grass seed, ground lime stone and new fencing material.

Mr. Hoose and I share the following expenses equally:—new machinery; feed; all other running expenses such as electric light, telephone, gasoline and coal for the dairy; the fee of the tester, furnished by the Dutchess County Herd Improvement Association, and the compensation insurance for the men employed on the farm.

Mr. Hoose on the other hand is to furnish all of the labor and all the horses in connection with the operation of the farm.

Now as to the receipts. We have agreed to divide equally the receipts from the sale of milk, prize money and the sale of surplus cattle. As it is our intention to keep the herd up to its present number and quality, it is contemplated that the young stock which is coming in will replace the oldest cat-

tle which gradually have to be weeded out.

This will give you an idea of the arrangement which I have entered into with Mr. Hoose. There are a few minor details which I have not recounted as they would only apply to our particular conditions. This arrangement has been in force since January 1st and it seems as though it was going to work out to the entire satisfaction of everybody concerned.

In regard to my orchard operations, James Bailey continues in charge as he has been since 1914. Mr. Bailey has an interest in the profits of the orchard and gives my orchard the same care and attention as though it was his own business.

We have purchased 600 Elberta Peach Trees which we are setting out as fillers and have also bought enough more Red Spy Apple Trees to complete the thirty acre field which we started to plant last year. We also bought 500 Red Rome Beauty Trees to plant in every third row with the Spys.

With Mr. Bailey in charge of my orchard and Mr. Hoose running the farm and dairy on shares, I feel that my farm operations will go forward as well this year as they have in the past.

Henry Morgenthau Jr.

means more for everyone. We should glory in our productive farms, for they mean that no one need go hungry. We should glory in our modern factories with their automatic machines and mass production, for they mean the ability to supply everyone with goods that only the rich could have if everything was still made by hand.

"But we do not live in a well-ordered world," Mr. Gregory continues. "Specialization and the complexity of modern manufacturing and trade make it impossible for us to trade what we produce with the producers of things we want."

Right here Mr. Gregory has put his finger on the cause of the trouble. There really is none too much food produced in the world, nor too many things manufactured. Somewhere there are folks who would be glad of this food and of these finely manufactured articles. The great difficulty is distribution. To bring the producer and the consumer together is where our modern civilization has fallen flatter than a good old buckwheat pancake.

To say that there is too much education applied to production or that there is too much machinery is foolish nonsense. Education and machinery mean efficiency, and no one wants to go back to the days of drudgery with hand tools. In fact our civilization would not last a week with the old hand methods. Our difficulty is, however, that we have not applied the same brains, the same modern tools, and the same general efficiency to distribution that we have to production. Hence our people starve or at least suffer in the midst of plenty.

Another chief cause of hard times is our dishonest dollar. What would you think of a yardstick that never twice was of the same length? Suppose when you went to use it one time, it would be 36 inches long, another time 43 inches long, and still another, only 24 inches long. How long would it take with such an inaccurate measuring stick to upset the whole field of mechanics?

Well, we have just that kind of a measuring stick in economics. Gold is our measuring stick. It is supposed to measure values. But the value of gold is never stable. Sometimes it is worth more, sometimes worth less. When there is plenty of gold in the world, money is cheap and prices of commodities are high; and vice versa, when gold is scarce, money itself is high in value but the prices of the things that it will buy are low. Hence, we have a constant up and down in prices which causes inflation and deflation, with millions of our people getting hurt all of the time by this constant swing of the economic pendulum.

Suppose you buy a farm today for five thousand dollars, and agree to pay for it ten years from now, only to find, at the end of ten years, that the value of gold has changed and instead of paying what you agreed to, that is, five thousand dollars, in reality you are paying six thousand dollars in actual value; or suppose you work hard and save up a little money to retire on in your old age—after you have retired the value of gold changes, and you find that your hard-earned savings do not go more than two-thirds as far as you expected. Millions of people with small incomes, like widows, retired farmers, and people working on salaries have had hard times for many years, because their money would not go far in purchasing high priced commodities. Now the situation is reversed, with low prices, so that money will buy a great deal more than it did.

Find some method of stopping this fluctuating value of gold and of increasing the efficiency of distribution, and I predict you will have solved the problem of the hard times.

A few thrifty fruit trees around the farm house or on the city or village lot mean more than just fruit and money to the owner. The new Cornell bulletin on growing fruit for home use tells how to grow the tree fruits, grapes, raspberries, strawberries, currants, in addition to the spray program, pruning, and the varieties to select. Ask the office of publications at the New York state college of agriculture at Ithaca, N. Y. for E 199. It is free.

A Visit with the Editor

If you are missing out on the AMERICAN AGRICULTURIST radio service to farm people, you are losing a real treat. AMERICAN AGRICULTURIST is on the air over WGY at the General Electric Company, Schenectady, every Monday noon and Wednesday noon from 12:25 to 12:30, and over WHAM at Rochester every day in the week except Sunday, at noon from 12:10 to 12:15. Get in the habit of listening in.

We give below an intensely interesting discussion on the causes of hard times, recently broadcast by E. R. Eastman, editor of AMERICAN AGRICULTURIST, at our noon period over WHAM. Read the common-sense article that follows and see if you do not agree that Mr. Eastman has put his finger on the chief reasons why we have to endure these economic depressions.

* * *

YESTERDAY I was eating lunch with a large manufacturer of farm equipment, and he made the remark that we are now passing through the strangest economic situation

E. R. Eastman

in the world's history. The more we have, the less we have; the harder we work and the more we produce, the worse off we are. It is hard to imagine such a situation, but that is just about what we are in now.

I pointed out to my friend that of course this has not always been true. Take the pioneer family, for example; the more and better crops he could grow, and the harder every member of his family worked, the more everyone enjoyed. If there was a large potato crop, it meant that the family would eat during the long cold winter. If the sheep did well and there was plenty of wool, everyone in the family had sufficient clothes. That was a natural, normal situation.

But in recent years this has all changed. For at least fifty years it has been true that the more potatoes farmers grew, the smaller the prices were and the worse off every potato grower was.

For a half century it has been true that the surplus milk, that is, too much milk, has been responsible for making dairymen poor. So it is with practically every agricultural product. Nor is this

situation limited to agriculture. It is true of all industry. The only difference is that when a manufacturer produces too much, it is easier for him to shut down and stop producing than it is for a farmer.

My friend, the manufacturer with whom I was eating yesterday, said that maybe agriculture would be better off if all the colleges of agriculture, the county farm bureau agents, and all the experiment stations and agricultural departments went out of business for five years. "The trouble is," said my friend, "that farmers know how to produce too well."

"Well," I answered, "if you are going to close the colleges and the departments of agriculture, then you must cut out the farm machinery, including the equipment your own company man-

ufactures, for machinery far more than the colleges of agriculture has been responsible for over production. And certainly you cannot blame the agricultural colleges for over production in the great manufacturing plants, for here almost the sole cause has been machinery. These machines not only have tremendously increased production but they have thrown millions out of employment."

In writing on this strange contradictory situation, my friend, Clifford Gregory, Editor of the *Prairie Farmer*, of Illinois, says that in a well-ordered world the more that is produced the happier everyone will be. We can only have what we produce and the more we make, the more we can have. A surplus should be no cause for worry. It should be a cause of rejoicing, for it

Life's Ifs

By DR. J. W. HOLLAND

The A. A. Philosopher

TWO high hurdles in life's race are the little words "if" and "but."

The poet told the truth who wrote
Of all sad words of tongue or pen
The saddest are these—"it might have been."

Dr. John W. Holland

Really, when one thinks too much of the "might have beens" he becomes a "has been." Too much lamenting over the past will interfere with the present and mar the future.

I have a farmer friend who said, "I have always had a difficult time to make a living on my farm. If I had settled just west of the river my life would have been a great deal easier." Maybe. Had he lived west of the river, conditions might have arisen which would have made him look longingly to the east of the river.

One cannot build a present happiness upon the miserable foundations of past ifs.

As children we played a game called "Supposing." The leader selected a member of the circle and said, "Supposing you were Abraham Lincoln (or someone else) what would you do?" It never occurred

to us to say "Johnny Smith, if you were really the Johnny Smith you might be, what would you do?"

The motto for a recent Young Peoples convention was "All of Myself, at my Best Self all of the Time."

Tenors want to sing bass, tall people want to be short, fat folks want to be lean, and lean ones fat. Many single people wish they were married and some married people pine for single bliss. And so it goes. It is all very foolish for it consumes energies that ought to be invested in positive living.

Anyway, may we not learn more from our mistakes than from our successes? May not the very admission to ourselves that we were once wrong be a great help to us in being nearer right in the future?

If you have done your best, forget the miscarrying of your plans; if you have not done your best, begin to do it now, and things will work out better for you.

"If conditions were different I could be happy," says one. "If prices were better, or I had better health—" say others, "all would be well. A brother minister said, 'If I had a different sort of people to work among—' Now let's stop this everlasting 'ifing' 'Maybeing' and 'supposing' trust ourselves, each other and pin our faith in Almighty God to change us from negative regretters to positive doers."

It's the EXTRA BUSHELs that make the PROFIT

Two famous Mid-West corn farmers. H. W. Dice at left, W. F. Meyers at right, both of Indiana. They used Chilean on this corn (125 lbs. per acre as side dressing) and won second prize and Grand Champion prize respectively at National Corn Show.

EXTRA BUSHELs of corn per acre... that's what you need to make a profit on your corn this year. And the way to make sure of those extra bushels is to side-dress your corn with Chilean Nitrate of Soda. A little in the hill, followed by a liberal side-dressing when the crop is knee high, will bring home the bacon.

Chilean Nitrate on your corn is like money in the bank. It supplies in most efficient form the quick-acting nitrogen the crop needs to make a big yield. It increases the ears per stalk, fills out the ears, and avoids firing in hot weather. Chilean is just about the whole difference between a money-making crop and the other kind.

NATURAL—that's why

Chilean is the natural nitrate. It is more than nitrogen. Thanks to its natural origin, it contains those valuable "impurities," Iodine, Boron, Magnesium, Potassium, Calcium, each a plant food in itself. It is the super-nitrate... Nitrogen PLUS.

Now packed in 100 lb. bags (the bag without a backache) and lower in price. More convenient. More economical. See your dealer. Say Chilean when you order and insist on Chilean. Two kinds... Original Chilean (Crystals) and Champion Brand (the pellet nitrate). Both are genuine, natural Chilean. Both are Nitrogen PLUS.

FRUIT
GROWER

Looking Ahead

What do you consider is ahead during the next few years for the fruit grower in New York State? Should we increase the acreage of fruit or should we look toward some other source of income?

THIS is a rather general question and the answer must necessarily depend upon conditions. It seems certain that the fruit grower who sets out new trees must be sure that he is putting them on soil that is favorable for their growth, and that he must expect to take care of them according to approved methods in order to cut production costs as low as possible.

We will certainly meet severe competition from other areas during the next few years and the only way to meet it is to put as good a product on the market as they do at a production cost which is as low as theirs.

Apples

The plantings of apples in Western New York have been rather light since 1924 and those set out have been largely McIntosh, Rhode Island Greenings, Baldwins, and Cortland. For the past year or two, plantings in the Hudson Valley have been heavier than they have in Western New York and consist mainly of McIntosh, Cortland, Baldwins, and Northern Spys. In Northern New York, in Essex and Clinton Counties, there have been fairly heavy plantings of McIntosh, Fameuse, Northern Spys, and Wealthy. The outlook, we believe, is good for the man who has an orchard on well drained soil of the right type, who produces high quality stuff, and who uses every possible means to keep down production costs.

Peaches and Pears

For the past few years the acreage of peaches in Western New York has been decreasing while there has been a slight increase of peaches in the Hudson Valley. We understand that for the past fifteen years peaches in general have not been particularly profitable in New York State. There are, of course, many individual cases where they are grown with success. The Oriental peach moth is almost certain to be a serious new pest, but probably this will be just as serious in other producing sections.

Very few pear trees have been set in Western New York since 1920. Some figures taken in Niagara County show that returns from pears have been about half those from apples. Competition from Pacific Coast States is likely to be increasingly heavy. Local markets and desirable varieties will make some ventures profitable.

Grapes

Heavy expansion in grape production throughout the country has reacted seriously on New York State grape growers. Since 90 per cent of grapes are grown in California, growers in other areas cannot expect much improvement in prices until demand catches up with California production. Consequently, the outlook is not encouraging for the setting out of more grapes on an extensive scale, or for that matter, is not particularly bright for those already in production. The solution for the man who has a producing vineyard is high production per acre and lower production costs through the efficient use of labor and every other possible economy. It may be most profitable for some men who have vineyards on land poorly suited to grapes to pull them out and produce something else. There are many farms and village homes where there are no grapes growing and a home vineyard is really worthwhile.

If you order trees, shrubs, vines, and perennials early from a reliable nurseryman, you can specify date of delivery. Then the shipment will arrive exactly when you want to take care of the materials.

One-year-old trees are the best trees for planting.

Eureka

SPRAYERS

Traction or Power

Do the biggest, most important job in raising field crops and fruit. Increase yield 50 to 200 per cent. Improve quality. Insure investment by destroying bugs, preventing mold and blight.

Traction Sprayer has 1, 2 or 3 nozzles per row; 4, 6 or more rows per boom. Wheels adjustable to width of rows. 60 to 100 gal. tanks. Double or triple action pumps. Thousands of satisfied users.

Combination and Power Sprayers for orchards, groves, and field crops, have 3 cylinder pump; pressure regulator; several sizes of engines and tanks for pressures 200 to 400 lbs. with spray booms and guns.

Discarding the Fore Milk

We understand that milk with less bacteria per c.c. can be produced where the fore milk is discarded. How much of this milk should be discarded?

TESTS recently made indicate that little is to be gained in discarding more than five streams of milk from each teat. The idea back of this discarding the fore milk, of course, is that some bacteria gain entrance to the teat canal and are carried away by the first streams of milk. Discarding the fore milk also serves another purpose. Because it contains very little fat it will, in a slight measure, increase the average butterfat content of the remainder of the milk.

Calf Taken by Caesarean Operation

JACOB C. PENDEXTER, a well-known Holstein breeder of Hiram, Me., found it necessary to kill a fine cow a few days before the date she was due to calve, March 24, 1930. In return for his assistance in killing the cow, Mr. Pendexter promised the unborn calf to a neighbor, Tracy Gilman by name, who had had some experience as a hospital nurse, and who proposed to remove the calf by making

an incision through the walls of the abdomen and the uterus.

Immediately after the cow was "knocked in the head," Mr. Tracy proceeded with the operation, meeting with complete success. The calf was found alive, and in two days was nursing from a bottle. Later Mr. Pendexter purchased it of Mr. Gilman, and now considers it one of his most promising heifers. The picture was taken on the occasion of its first birthday anniversary.

Production and Heredity

Is it likely that the herd sire will produce heifers with higher production when he is old than he will in the younger years of his life?

PRODUCING ability is mainly a matter of heredity. The Missouri Experiment Station after some tests along this line, report that daughters sired by a mature bull were not superior in production to those sired at an earlier age.

Cottonseed Meal Not Injurious

Is there any basis for the idea that too much cottonseed meal is injurious to the dairy?

THE Journal of Dairy Science recently reported that there is little or no danger of cottonseed meal injury to dairy cattle where they are getting good clover hay. They maintain that liberal feeding of cottonseed meal to dairy cattle along with ample hay of high quality and corn silage had no bad results, and that it did not increase any susceptibility toward udder infection.

When buying a bull to raise heifers from, look for proven milk production in the pedigree.

"1/3 of a silo of corn
for \$1.50"

Up in Remson, N. Y., Webb A. Brown & Son plant about 7 acres of corn yearly to fill a 30 x 18 ft. silo. Troubled with crows they tried Stanley's Crow Repellent. Now they say "No more crow trouble. Would not plant corn without Stanley's Crow Repellent. The crows never land on the field after they try it. Saves from 1/3 to 1/2 of the crop. Banishes the bug-bear of replanting." Think of it. You can add from 1/3 to 1/2 to your corn crop for a \$1.50 can—enough for 2 bu. of seed. Small can \$1.00. If you can't get a can from your drug, hardware or seed store, order direct. The Cedar Hill Formulae Co., Box 500-M, New Britain, Conn. Write today!

Be sure you get

STANLEY'S CROW REPELLENT

Your Money Back! We have been making Stanley's Crow Repellent for over 20 years. We know how it will rid your corn field of crows, gophers, squirrels and other pests without killing them. We back up Stanley's Crow Repellent with a money-back guarantee. Write today for a can before planting time.

For 25 Years—and More!

There are Craine Triple Wall Silos erected and in use for 25 years or more. Reviewing the Markets

Crop profits cannot be safeguarded by half measures

Potato Blight is the most successful thief of profit, with which growers have to contend. The one sure control for Blight is Bordeaux Mixture, applied five times. Set your nozzles to cover both top and bottom of leaves. Be sure your Bordeaux is of correct strength—and fresh. All authorities agree that home mixed Bordeaux, used fresh, is most effective and most adhesive.

To safeguard the purity and strength of your Bordeaux Mixture, to insure its being free from dirt and inert matter—to make sure you can spray it as finely as you like, without nozzles clogging—use only

Milk Prices

April Prices

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk (Metropolitan area)	2.90	2.70
2 Fluid Cream		
2A Fluid Cream	1.65	
2B Cond. Milk		
Soft Cheese	1.91	
3 Evap. Cond. Milk Powder		
Hard Cheese	1.50	1.30
4 Butter and American Cheese. Based on New York City Market quotations on butter and American Cheese.		

The Class 1 League price for April 1930 was \$3.37 for 3.5% milk and Sheffield's \$3.17 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of weighted average.

Butter Down and Up Again

CREAMERY SALTED	April 24, 1931	Apr. 18, 1931	April 25, 1930
Higher than extra	25 1/2-26	25 1/2-26	39 -39 1/2
Extra (92 sc.)	25 -	25	38 1/2-
84-91 score	22 3/4-24 3/4	23 1/4-24 3/4	33 -38 1/4
Lower Grades	22 -22 1/2	22 1/2-23	31 1/2-32 1/2

The butter market for the week ending April 25 started out in bad shape. Heavy receipts and a slow buying demand forced the price on creamery extras down to 24c on the opening day. This rate continued through Tuesday and Wednesday. On

Effective May 1, the New York market reports broadcast daily over WEAF will be at 1:00 to 1:15 p. m. daylight saving time, that is, 12:00 to 12:15, Eastern Standard Time.

Thursday a better demand developed and prices recovered to 24 1/4c-25c. This continued on Friday and creamery extras went to an even 25c.

There appears to be little hope of any immediate improvement in the butter market with reports coming from the Western producing districts to the effect that the production of butter is on the increase. It is becoming very evident that the season is considerably ahead of schedule. A great deal of stock arriving is beginning to show the effect of early grass. This is particularly true of butter coming from points South of Nebraska. Many buyers are discriminating against the high colored butter, the consumer preferring a light colored product.

The chain stores have reduced retail prices and it is expected that consumption will be greatly increased, in order to take care of the heavy increase in supplies that are coming forward.

Fresh Cheese Easier

STATE FLATS	April 24, 1931	Apr. 18, 1931	April 25, 1930
Fresh Fancy	13-15	14-15 1/2	18 1/2-
Fresh Average			
Held Fancy	21-22 1/2	21-22 1/2	24 -26
Held Average			23 -

A sharp decline in the Wisconsin cheese market early in the week ending April 25 was the main factor in causing the lowering of the price on fresh New York State cheese as much as 1c per pound. In spite of the reduction, trade is very slow in freshly made goods. However, reports from the West state that the market out there has turned a little steadier. The cheese market is bound to react under the influences surrounding it, and the butter market is having considerable influence.

Held cheese still holds steady. There is moderate trading in this line and prices are fairly well sustained. However, the situation could be a whole lot better.

Eggs a Shade Lower

NEARBY WHITE	April 24, 1931	Apr. 18, 1931	April 25, 1930

The egg market continued to be a Chinese puzzle. On April 20 the market opened a fraction below the close of the previous week. Receipts were heavy and the situation was weak and unsettled. A slow distributing trade and an inactive speculative market naturally caused this situation. At the same time, storage stocks are being added to freely. This is causing a downward trend in the market on mixed eggs from Western producing sections, which in turn is having a direct effect on the nearby trade. On April 21, 22 and 23 the market showed a firmer tone on straight car business of storage packed

eggs. Real cheap eggs also showed increasing firmness. Western gathered eggs have a great attraction at the present time, while our high quality, nearby products continue to sell at lower prices. On April 24 heavier posted receipts turned the market easier, and the undertone is quite unsettled.

The recent warm spell is beginning to show up in the egg market in the form of shrunken yolks. Perhaps more of that complaint will swing the trade away from those cheap eggs and give our high quality nearby product more attention.

The live poultry market was badly in need of soothing syrup during the week ending April 25. On every day of the week the market reversed itself and was a most emphatic demonstration of the oft' repeated statement that what this country needs most, is more efficient distribution of our products. In general, heavy colored fowls have lacked demand. Leghorn fowls have been getting a good call. Broilers have generally sold well.

Hay Market a Shade Lower

A single barge load of hay arriving in New York this week was responsible for a reduction of one dollar a ton. Receipts were light up to that time and prices might have held. However, the barge load of medium and low grade stock (equal to 25 cars) was enough to cause a shading of price. The market closed just about steady and no more. Timothy has been selling over a range of \$21 to \$26 depending on grade and size of bale. Timothy containing a light mixture of clover is now bringing anywhere from \$20 to \$25 with grass mixtures ranging from \$19 to \$23.

Meats and Livestock

CATTLE—Load medium 1187 No. Pennsylvania steers steady at 7.50. No bulls offered. Few low cutter and cutter cows steady from \$2.00-3.50.

VEALERS—Steady. Good to choice 8.00-10.00. Mediums 6.00-7.50. Cull and common 3.00-5.50. Most offerings of New York and nearby origin.

HOGS—Few medium grade heavy weight hogs about steady at 7.65.

COUNTRY DRESSED CALVES—Receipts were light during the week. Trading slow in early part, active at end. Prices were steady at beginning and fully two cents per pound higher at close. Market closed steady and cleaning up. Fresh receipts per pound: Choice 11-12c; fair to good 8-10c; small to medium 6-9c.

HOTHOUSE LAMBS—Receipts moderate to liberal during the week. Demand slow. Market closed steady at \$3.00-9.00 each, most sales around 5.00-7.00.

Plants Hardy Field Frostproof Cabbage. Dozen leading varieties. 300-\$1.00; 500-\$1.25; 1000, \$2.00 prepaid. Express: \$1.00-1000. Tomato, disease proof, Marglobe, Bonny Best, Baltimore. 500-\$1.50; 1000-\$2.75 prepaid. Express: 10,000-\$17.50—hundred per cent good plants and delivery. Better quality mean profitable crop.

AMERICAN AGRICULTURIST

THE McCORMICK-DEERING HARVESTER-THRESHER

Descendant of the McCormick Reaper of 1831

The mechanical conquest of the grain harvest was man's first great victory in the march toward his destiny. Once this barrier was leveled the road lay clear to endless accomplishment.

INTERNATIONAL HARVESTER AND THE CONQUEST *Of the Harvest*

HUNGER remains the first great urge of the race. The need of food must ever be served, but the dread of famine no longer haunts humanity. Each day plentifully answers each day's recurring cry for bread. Today it is easy for ten million tillers of the soil to take from it food for a population of more than one hundred and twenty millions.

If suddenly the machines of the harvest, the children of the McCormick reaper, were to vanish beyond replacement, the great edifice of civilization would fall in ruins. Through the simplest instincts of men the cities would empty themselves and the feet of the multitudes would be shackled again to the soil.

Stark necessity would enslave the learning of the scholar, the genius of the scientist, the dreams of the poet and the philosopher, the trained hands of the surgeon, the artist, and the artisan. For the talent of the race is of little avail without conquest of the harvest.

Such a return to the past brings utter calamity to mind, yet it leads but to the generation of our great-grandfathers. A single century—a moment of time in the history of the ages—has seen the modern harvest built up on the invention of the reaper.

In 1831, grain was cut with the hand sickle and the cradle, bound by hand, and threshed by the treading of animals or with flails. Many hands and many hours were

required to wrest the yield from each stubborn acre. As when Ruth went to glean in the ancient fields of Palestine, untold toil lay between the growing grain and the precious loaf of bread.

In 1831, the reaper of McCormick moved down the Virginia field cutting a swath of wheat. For the first time in the story of mankind a machine successfully reaped grain and did the work of many men. In that Virginia field—birthland of the new Agriculture—an event was written into history greater than all the wars of conquest.

With that event the century took wing. The

reaper led swiftly on to new triumphs. The mechanical thresher lent its voice to the new music of the fields, and the simple flail joined the sickle in oblivion. The self-binder was invented, and the lone man with his machine cut as much grain as twenty-eight sickle-wielders in a summer's day. By the early Seventies, when the new factories of the indomitable McCormick had risen like the phoenix from the ashes of the great Chicago fire, one man with his machines brought in a harvest that would have taxed the powers of a whole village in the olden time.

In the early years of the present century came the bold, long step that led to the modern harvest. Cutting and threshing were combined in the field in one great machine called the harvester-thresher or combine. With the larger McCormick-Deering harvester-threshers of today, operated by tractor power and sweeping down the broad fields in 16-foot swaths, two men easily do the work of two hundred wielders of the sickle and the flail. With modern grain machines and milling methods the grain that waves in the breezes of today may be the bread of tomorrow's tables in the heart of the great city.

The International Harvester Company in the time of this Centennial is proud of kinship with the McCormick reaper, and proud, too, of the modern harvesting equipment it is manufacturing for the grain fields of the world—equipment essential to the existence and the progress of the human race.

ANNOUNCING

A NEW LINE OF LOW-PRICED SIX-CYLINDER TRUCKS WITH CHEVROLET-BUILT BODIES ESPECIALLY ADAPTED TO FARM USE » » »

Now you can buy a Chevrolet six-cylinder truck chassis and a Chevrolet-built truck body as a complete unit.

These new bodies are designed by Chevrolet engineers and produced in Chevrolet plants, exclusively for the three Chevrolet chassis. Made of finest hardwood-and-steel and built to rigid standards of strength and stamina, they have the ability to take plenty of punishment—to stand up well throughout many seasons of hard, constant service.

In addition, they have the size and support for maximum load capacity. Bodies for

the commercial chassis offer six-foot load space; for the 131-inch model, nine-foot; and for the 157-inch model, twelve-foot.

Whether it's a light pick-up you need for carrying supplies around the farm, or a large truck for carrying produce to market—Chevrolet now has a fine-looking, 50-horsepower six-cylinder unit—complete with Chevrolet body and chassis—to do your work dependably. Prices on all models are uniformly low. And the cost records of large fleet operators show that Chevrolet's cost-per-mile is the lowest of any truck on the market.

CHEVROLET SIX CYLINDER TRUCKS

Bodies by Fisher for the new Chevrolet Six provide maximum comfort, safety, and value

Body by Fisher for the Chevrolet Six provides precisely the same strong type of wood-and-steel construction as found in the most costly cars, plus truly fine-car qualities of comfort, convenience, and safety.

These bodies are built of staunch hardwood frames and strong steel panels. They are sturdily braced with metal and are notably free from rumbles and other unpleasant noises. They retain their fine appearance and riding comfort for a long time even under severe driving conditions.

Furthermore, Chevrolet Bodies by Fisher have many luxurious features which are usually found only in cars of much higher price. Upholstery fabrics are beautiful and long wearing. Driver's seats are adjust-

able to accommodate the individual driver. The Fisher non-glare vision-ventilating windshield provides instant and complete control of ventilation. It can be operated with one hand even while the car is in motion.

All glass, in doors and windows as well as in the windshield, is genuine plate, affording clear and undistorted vision in all directions. And Chevrolet Bodies by Fisher are insulated against weather and noise.

Chevrolet alone in its price field can provide you with these manifold Fisher advantages, because Chevrolet is one of the General Motors cars—the only cars with Body by Fisher.

FISHER BODY CORPORATION / DETROIT, MICHIGAN
Division of General Motors

Real comfort for every driver

The Fisher adjustable driver's seat (1) moves forward and back through a range of three inches, to accommodate the individual driver. The accessible handle (2) provides convenient adjustment.

Staunch hardwood body frame

Strong, tough hardwoods, reinforced with metal braces, make up the staunch framework of Chevrolet Bodies by Fisher. This construction explains their great strength, durability, and value.

Away with spring fever!

here's *the wake-up food!*

SPRINGTIME! That's the time for *quick new energy*. That's the time to eat Post Toasties. It's *the wake-up food*—and why? Because it is so easy to digest, so quick to release its stored-up energy to the body. Serve your family Post Toasties. Give them all—big and little folks alike—a brisk, bright start each day. For breakfast, send these golden flakes of crisp corn hearts afloat on pools of pure, sweet milk or cream. Delicious, you'll say, *delicious!* And just as good for lunch and for a night "snack" too. For every day economy, serve Post Toasties—*the wake-up food!*

Farm News from New York

Roosevelt Comments on Health Bill---Bankers Take Marketing Trip

GOVERNOR ROOSEVELT in signing the State Health bill providing \$750,000 for the establishment of new hospitals and new research departments in the State, criticized the Legislature for failing to ratify the program proposed by the special Health Commission. In commenting on defects of the present bill, Governor Roosevelt said:

"The accomplishments of this bill are momentous in the advancement of the public health of the State. It is, indeed, a pity that in the interest of protecting the lives and health of its millions of citizens, the Legislature could not have, at least on this one question, forgotten its attitude of obstruction and opposition and could not have taken the recommendation of this commission of experts in full."

No Change in League Class Prices for May—Production Continues Heavy

DIRECTORS of the Dairymen's League met at New York on April 23. There will be no reduction in class prices for the month of May.

In the New York milk shed, production per day per dairy is 15 to 20 per cent higher than it was at the same time last year. Warm weather during April has doubtless been partially responsible for improvement in demand, whereas in March the demand was about 10 per cent below the same period last year, and at this writing demand is estimated as around from 4 or 5 per cent below last year. On Monday, April 20, the wholesale price of 92 score butter on the New York market hit 24c, a new low level. It is worth while for producers in the New York milk shed to do a little figuring to convince themselves that at that butter price, milk to be made into butter would net the producer not much over 60c per cwt. There was a time when the price of milk produced in the territory now known as the New York milk shed was largely determined on butter and cheese prices.

No Market for Milk

ACCORDING to Fred Sexauer, president of the Dairymen's League, in a talk last week, many independent dairies have no market for their milk. Mr. Sexauer says that "at no time in the history of milk industries, has quality been so important in the market."

He further states: "Plenty of best quality milk today supplies the market for either fluid or manufacturing purposes. Milk which does not meet these standards goes begging. When surplus appears on markets, quality becomes doubly important."

An interesting fact in this connection is that at the present time, more dairymen are applying for membership in the League than for several years past.

Apple Festival Held Soon

ABOUT thirty cities and villages in the Hudson Valley are participating in an "Apple Festival" to be held on the 8th and 9th of May at Germantown. On Friday afternoon, May 8th, the New York Giants will play an exhibition game with "Hudson Valley All-Stars," a picked team.

On Saturday morning, there will be a children's pageant and on Saturday afternoon the Hudson Valley Blossom Queen will be selected.

A large attendance is promised at this "Festival" in the Hudson Valley fruit growing area.

Bankers Take Marketing Trip

THOSE who had the opportunity to be present on the recent Farm Bureau Marketing trip to New York City, will be interested in the fact that the New York State Bankers' Association is contemplating a similar trip. Much the same schedule will be follow-

ed with visits to the New York produce markets, a retail milk plant, and the Walker-Gordon Rotolactor being on the itinerary.

This trip taken by the State Bankers should give them a more complete picture of what happens to the farmer's produce on reaching the city. At no time has the cordial feeling between the farmers and their bankers been as necessary as now. Such mutual interest as the proposed tour should help promote these relationships.

Sheffield Farms Distributing Plant at Hampton Bays

THE Sheffield Farms Company has just announced the purchase of property along the Montauk Highway at Hampton Bays, Suffolk County, Long Island, where it will establish a milk distributing plant to serve 46 towns on the East end of the Island. Up until the purchase of this property, Sheffield Farms had served the Eastern end of the Island by selling milk to local distributors, the nearest Sheffield distributing plants being located at Blue Point on the South Shore, and Glen Head on the North Shore. Now the new milk distributing plant at Hampton Bays will make deliveries direct to consumers on the East End of the Island.

Fishermen Pleased

THE Conservation Department has inaugurated a new policy of closer cooperation between game protectors and sportsmen. Reports show to date, that this policy has been very successful in promoting the better relationship between the fishermen and those in charge of law enforcement.

I can remember as a small boy how I hid behind the stone wall while the game protector went by. The small boy nowadays need not fear the "fishing cop." He is there to protect the fisherman and to give advice as to where the best fish can be caught.

State Conservation Commissioner Henry Morgenthau, Jr., in a recent talk at Malone said:

"We have found that it is not sufficient merely to buy and hatch more birds and to hatch and plant more fish. That doesn't necessarily mean increasing our stock. We are not so much in-

terested in how many thousand trout fry we can rear. What we are interested in is how to make the fishing better for sportsmen. We are not so much interested in the record of how many pheasant eggs have been distributed as we are in what kind of sport a man

gives the various countries a better idea of world agriculture.

Boys and Girls Plant Trees

FOUR-H club members will plant approximately one million trees this year, according to a report from the Conservation Commission. Club members have already sent in 950 orders to the tree agents. The boys and girls are to be complimented on their start in their forestry project as all have agreed to plant the young trees properly and to continue to guard them from fires and insects. Boys and girls who set their plantings now will probably live to see the trees grow to a merchantable size for use on their own farm in future years.

Fire Hazard Still Present

ALTHOUGH rain has temporarily lessened the danger we want to caution our readers again about the extreme fire hazard existing throughout the state. One hundred eighty-eight fires were reported to the Conservation Department last week and only the absence of high winds saved the loss of much valuable property.

At the present time, all fires are under control but there is a constant possibility of more starting especially in the Adirondack and Catskill regions which have previously been immune. Remember, one lighted match or cigarette stub may do untold damage.

The Storrs Egg-Laying Contest

THE highest weekly yield for the year features the Storrs contest report for the twenty-fourth week. The total production for all pens was 5,453 eggs or a yield of 77.9 per cent. Thus, the birds bettered the previous week's lay by 75 eggs and beat the corresponding week last year by 146 eggs.

Three classes, namely Australorps and Giants, Barred Rocks, and White Leghorns, did over 80 per cent. Rhode Island Reds did better than 77 and the remaining classes came through with well over 60 per cent production. Thus, there was no poor performing group in the entire outfit.

Last week exactly eleven pens tied for the first three places. West Neck Farm's pen of Rhode Island Reds from Huntington, L. I. shared first honors with J. A. Hanson's pen of Leghorns from Corvallis, Ore., these two pens scoring 67 points each.

Donald I. Goodenough's pen of Reds from Torrington, Conn. tied for second place with the four following pens of Leghorns: Egg and Apple Farm of Trumansburg, N. Y., Wene Chick Farm of Vineland, N. J., and Hollywood Poultry Farm of Woodinville, Wash. These five pens scored 65 points each.

A third pen of Rhode Island Reds, entered by Parmenter's Red Mount Farm from Franklin, Mass., tied for third place with Tom Barron's pen of Leghorns from Catforth, Eng. and two pens of Barred Rocks, bred by Hawes Bros. from Union, Maine and the Registered Poultry Breeders' Ass'n. from Fredericton, N. B., Canada. These four pens scored 64 points each. Storrs, Conn., April 21, 1931.

Safety First

ways is an item of considerable interest to visitors.

"Say, Driver," remarked a tourist, "there seems to be a nice class of employees here in the Park. All college students, I understand."

"Not all of them," replied the driver, who did not happen to be one.

"That so? I was told they were."

"Oh, no. You see, they have to hire a few people who know something."

WGY Broadcasts Changed

On April 27, due to the change in time in many of the cities, the American Agriculturist broadcasts over WGY will be moved from their present time.

On Tuesdays at 12:40 Eastern Standard Time, the American Agriculturist farm news briefs will be broadcast, and on Thursdays at 12:40 Eastern Standard Time, we have "Editor Ed Looks at Life."

finds when he goes out in the woods and field with old double-barreled guns."

The new attitude of the Conservation Department has received the endorsement of sportsmen in all parts of the state.

Youngest Grange Lecturer

MISS ELLEN TAYLOR, 16 years of age, of Waterport Grange, is said to be the youngest Grange lecturer in New York State. Miss Taylor has arranged some very attractive features to date, and a good program is always assured.

International Congress Meets

PRAGUE, the Capital of the Czechoslovak Republic, is making elaborate preparations to receive adequately the delegates of the Fifteenth International Agricultural Congress. The Congress will take place at Prague on June 5-8, 1931.

The International Agricultural Congress has done much to promote better relations between nations which have agricultural interests. Information has been gathered by representatives of the Congress which, when presented,

New York County Notes

Columbia County—March winds, April showers, and May-like sunny days made up the last week's weather. Farmers are plowing and ground is in fine condition for that work. Potatoes are \$1 a bushel. Eggs 25 cents a dozen, butter 30 cents a pound.—Mrs. C. V. H.

Monroe County—We are having grand weather, no rain in two weeks to amount to anything, warm sunshine every day which, if it continues, is going to force the buds on apples too fast, if we should get a frost later. Apple buds are showing green on Baldwins, while Twenty Ounce and early apples have small leaves started.

Some are spraying. Spring grain is nearly all sown; will be all finished this week if weather permits. Ground works up the best it has in years because it is good and dry down in the subsoil. Apples promise a good crop of blossoms especially the commercial varieties such as Baldwin, Greening, Spies and Twenty Ounce. Much nitrate is being used instead of tillage.—T. D. S.

Genesee County—A fine rain last week helped meadows, pastures, and the winter wheat which came through the winter unusually well this spring. Farmers are very busy fitting the land and sowing peas, barley, and oats, and planting early potatoes. Some lands are still wet.

A Genesee County production and market survey meeting was held at the Batavia Court House April 9. After a survey of 81 Genesee County farms they concluded the weak spot in farm-

ing was the preparing for market. They decided that grading would bring better results. The use of certified seed was also stressed. Seed treating and spraying of potatoes was found very helpful.

Potato seed treating by hot corrosive sublimate began this week. It is expected that there will be between 25,000 and 30,000 bushels of seed to be treated in this county.

Harold Failing, of Lowville in Lewis County, a graduate of Oswego Normal School, and S. R. Shapley, assistant Farm Bureau agent, are in charge of the treating.—Mrs. R. E. G.

Western New York Notes

SPRING'S work is now in full swing. Rain is badly needed; grass grows hardly at all and the ground is getting too dry to plow well.

The season program of County road work has begun.

The Associated School board of the district including Niagara, Erie, Chautauqua, Wyoming, Allegany, and Cattaraugus Counties met in Olean, April 16.

The Niagara Falls High School Chronicle has received the Post-Standard cup for the second consecutive year as being the best scholastic newspaper published in New York State. Two Buffalo publications rated high. The Oracle is published by Lafayette High School and the Chronicle, by Fosdick-Masten High School.

Bishop's Poultry Farm, New Washington, Ohio

With the A. A. POULTRY FARMER

A Suggestion for Warm Weather Brooding

THIS is not a new idea. To the old-timers in the poultry game it is probably regular procedure. The only reason for mentioning it at all is that each season many people are operating coal stove brooders for the first time, this hint may prove helpful to them.

At this time of the year and later the nights are cold and a fire in the brooder stove is very necessary, but the days become so warm that the heat is not needed. Indeed it may become so hot and stifling in the house that even with the windows all open it is too hot for the good of the chicks. It might seem like a logical thing to let the fire go out on such days. The one who suggests that has not had much experience in building fires in brooder stoves.

The common practice is to keep the stove running but checked as much as possible without going out entirely. By raising the canopy away from the stove the heat is not held so close to the thermostats of the draft regulator. This makes it possible to run a lower fire without completely checking it. If the chicks are large enough to be partially feathered the canopy can be left off all the time. With smaller chicks it can be raised to the roof by means of an attached rope and pulley, and then let down again at night. The stoves usually come equipped with such means of attachment.—L. E. WEAVER.

Broody Hens

IN these modern days it is the hens' job to lay eggs, and to take no further part in the business of motherhood. Incubators and brooders are built to do that. It seems to be a difficult matter to convince some hens of the desirability of this arrangement. They insist on wanting to quit the job of laying, and to spend three weeks in quiet and seclusion. And then following this with several very active weeks doing what the incubator and brooder can do exactly as well and much more efficiently.

We know that their minds can be changed. The setters can be broken up, and by very easy means. A well ventilated broody coop with wire or slatted bottom should be always ready. The first night that a hen stays on the nest instead of going on the roost she should be confined in the coop. Give her all the mash and all the fresh water she wants. The sooner broody hens are shut up and the more food they can be coaxed to eat the sooner they will be back on the job. With good hens it will be only a few days.—L. E. WEAVER.

May, a Month of "Days" and "Weeks"

Not Only Child Health, but the Mother's Too is Emphasized

THE early part of May is especially devoted to emphasizing annual weeks or ideas.

May 1, May Day, is always Child Health Day, and this year it has been devoted to carrying out ideas which were promulgated at the recent White House Conference on Child Welfare. Much has been done to make childhood a safer business, but much yet remains to be done.

The second Sunday, May 1, is always devoted to the idea of Mother's Day. This year certain health organizations are striving to give Mother's Day a new angle. We are quite accustomed to the idea of devotion and reverence which Mother's Day everywhere should receive, but this year we want to emphasize the necessity for making motherhood safer for the mothers. In the United States alone, every year there are 16,000 mothers who die in childbirth, the largest proportion of such deaths in any civilized country. This means that 16,000 babies have to go on in life without their mothers, and this can be avoided, at least among two-thirds of that number. If prospective mothers have the proper care before the baby is born, then in by far the greatest majority of cases the natural event of bearing a child should not bring any dire results.

The Public Health Service in Washington, the Maternity Association of New York, the State Health Department at Albany, and a great many health organizations in the counties are doing their bit to bring to the minds of the public the necessity for maternity care. In this way, there will be fewer

white carnations worn on Mother's Day, and more red ones.

May 10 has been selected, not only as Mother's Day, but also as Rural Life Sunday. Not only should the day's service be devoted to Mother's Day, but also to the idea of a fuller life in the rural districts. The Home Missions Council, 105 East 22nd Street, New York City, has a pamphlet "Rural Life Sunday" which contains an excellent suggested service which combines

tom to give the stand a finished appearance.

The hat-cover may be made from one-third yard of the 54-inch glass cloth, as follows: Cut a circle 13 inches in diameter and a rectangular piece 12 inches wide and 41 inches long. Join the two ends of the rectangle with a one-fourth inch flat seam, blanket stitched. Join one edge of this to the circular piece with a flat seam, blanket stitched. The lower edge should be turned up and held in place with the same stitch. The insertion of number 18 copper wire in this fold will help to keep the base of the cover in shape. A bone ring sewed to the center of the top will serve as a convenient handle.

Mayflowers

*Hark! at the call of the sweet, fresh
May morning.*

*Hear them come trooping on gay
dancing feet!*

*Over the meadow green,
Down through the woodland sheen,
Up from the village and thronged
city street.*

*Sunbonnet babies with little snub noses,
Rollicking youngsters with merry
blue eyes,
Small Cinderellas gay,
Sweet as the breath of May,
Dreaming of fairies in godmother
guise!*

*Hark to their chattering! Tiny Maid
Marian,
Helen and Marjorie, Bobby and Ted;
List to their laughter sweet,
Just see their flying feet,
Richard and Emmy and turbulent
Ned!*

*Here they come gleeing, slim lads and
lasses,
Shy adolescents awakening to truth,
Seeking life's miracle,
Knowledge empirical,
Springtime,—the Maytime when
youth calls to youth!*

*Set up the Maypoles, with streamers
aflying,
Riot of color for each eager hand;
Great Nation's greatest wealth,
Children in radiant health,
Fairest of flowers that bloom in our
land!*

*Never mind training them just to be
citizens,
Never mind urging, too fast,
wisdom's way;
Give them the room to grow,
Give them the joy to know
Laughter and lilting song; give them
their May!*

—WINIFRED HATHAWAY,
Associate Director
National Society for the
Prevention of Blindness.

Rural Life Sunday and Mother's Day. This pamphlet may be had for 3 cents a copy, or \$2 a hundred, by writing to the Home Missions Council.

Keep Hats in Shape

KEEPING hats in shape has always been a problem for homemakers and Miss Hazel Hill, Extension Clothing Specialist of the University of New Hampshire, is offering aid in that direction by telling how to make a very satisfactory homemade hat-stand. Her directions for making such a hat-stand are as follows:

About one inch of pebbles are placed in the bottom of a two-pound oatmeal box and covered with a snug-fitting piece of round cardboard, which is stuck in place with sealing wax. The cover is placed on the box, covered with cotton to pad the edges, and a circular piece of cretonne two inches larger in diameter than the cover tied over the cotton. A similar piece of cretonne is fastened to the base of the box. A rectangular piece of cretonne one and one-half inches wider than the height of the box and long enough to fit smoothly around it and allow for a seam is stitched to form a cylinder, slipped over the box, and sewed in place at both ends. A band of bias binding can be sewed at the top and bot-

Preserved Rhubarb

5 lbs. Rhubarb
5 lbs. Sugar
1½ lbs. Figs
2 Lemons
½ lb. Raisins

Cut rhubarb into small pieces, sprinkle sugar over it and let it stand over night. The next morning pour enough hot water on figs to wash thoroughly, then drain and cut into fine strips. Put raisins through a food chopper. Add raisins and figs to the rhubarb with the juice and grated rind of the lemons. Cook until thick and when cold, seal in jars.—L. A. C.

Slimming Lines

DRESS PATTERN NO. 3053 would be a very fortunate choice for the figure wishing to take advantage of slimming lines. White shantung trimmed with vivid red, polka-dotted linen or pique, pastel washable silk or the lovely sports cotton materials would be charming in this design. The pattern cuts in sizes 16, 18 years 36, 38, 40 and 42-inches bust measure. Size 36 requires 3¾ yards of 39-inch material with 2¾ yards of binding. PATTERN PRICE 15c.

GLADIOLUS: 5 Giant Nymph bulbs, 1 Mother Machree bulblet and 100 Regal Lily seeds, included with 100 mixed bulbs or 10 each 5 varieties, labeled, \$1.25, prepaid. Price list. C. A. WOOD, Box 14, BROOKTONDALE, N. Y.

Modish Peplum

JUNIOR DRESS PATTERN NO. 3071 shows sufficient smartness of style to satisfy the most exacting young miss. Printed batiste, crepe de chene, lawn, dimity, or rayon novelty print would be very charming in this capelet-peplum model. The pattern cuts in sizes 8, 10, 12 and 14 years. Size 8 requires 2¾ yards of 39-inch material. PATTERN PRICE 15c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and inclose with correct remittance in stamps. Add 12c for one of the new Spring catalogs and address to Pattern Department, American Agriculturist, 10 N. Cherry St., Poughkeepsie, N. Y.

The Story Thus Far

Jim Stuart sees a drifting canoe. He and Omar, his Indian guide, start out at considerable risk and rescue the person hanging on to it. They find it is a girl, the daughter of LeBlond, the head of the rival trading post. Omar's wife, Marthe, thoroughly disapproves of the knickers Aurore LeBlond is wearing.

Jim's next trouble is how to get her home. It was impossible to cross the lake; it is miles around and Jim feels that LeBlond will not be pleased to have his daughter stay at his rival's camp. Aurore seems to approve of Jim and there are indications that the approval is mutual.

In the course of the conversation it develops that Paul Paradis has been making disparaging remarks to Aurore about Jim.

During the evening Omar sees landers approaching and concludes that it is a searching party. Before Aurore's father appears she and Jim plan a meeting place on an island half way between the two posts.

* * *

With a voice hoarse with feeling, he said, with a slight trace of accent: "Mr. Stuart, my daughter says she owes her life to you and your man."

As they faced him, the striking resemblance in feature and expression between father and daughter impressed the man who entered the room followed by Renault and Paradis. The girl who had hung to the canoe while the seas drove over her, then laughed as she shook with cold, was the true daughter of Louis LeBlond.

"Luckily, we happened to see her," depreciated Stuart.

"Yes, but she tells me that her strength was gone—she had already given up, when she saw you." LeBlond impulsively grasped the hand of the man who studied him. "We are rivals in business; it cannot be helped. But what you have done for my child I will not forget. We have hunted for her since the afternoon. I have been half crazy. You will understand."

In a corner of the room the slim Paradis, dark as a half-breed, talked excitedly to the thick-set Renault, across whose swart face a knife slash had left a livid scar.

"It was nothing," replied Stuart. "I happened to see her canoe. That was all. You owe me nothing, sir." As he spoke, Paradis left Renault and whispered in LeBlond's ear.

"My house is at your disposal," continued Stuart. "Will you and your daughter stay here tonight?" The eyes of the speaker hardened as he went on. "The gentleman who is whispering to you and Renault, here, are welcome to sleep in the trade-house. You can't cross the lake against this wind."

The somewhat small but regular features of Paradis darkened in a scowl at the thrust, but he continued his whispering. Slowly a look of doubt—of perplexity—crept into LeBlond's eyes, but with a gesture of irritation he waved aside the insistent Paradis. Turning, he spoke rapidly in French to his daughter, who replied vehemently, her courageous black eyes flashing in anger as she faced her father.

Paradis Tries to Start Trouble

"Mr. Stuart," said the patently embarrassed LeBlond, "you—a—found her in the afternoon?"

"Yes." In a flash Stuart sensed what was coming—what Paradis had been whispering.

"And you let us hunt the lake through six hours of daylight—hunt for her, thinking she was drowned?" LeBlond spoke more in regret than in anger.

"Why didn't you send word?" added Paradis with a sneer.

"Father!" The blood rose to Aurore LeBlond's temples. "Are you crazy? Do you know what you're saying? Is this your gratitude?" The eyes of the girl flamed with indignation. "Mr. Stuart wanted to take me home, but I wouldn't go. There was only the small canoe here, and I was afraid—afraid of that lake. And this is your thanks to him! Oh, I'm ashamed of you—ashamed of you all!"

The enraged factor of Sunset House was near the end of his self-control as he faced LeBlond. "You see fit to quibble over my actions to-day. I've nothing to explain. You found out what the lake was out there, when you crossed with the wind in your big canoe. My large boats are bringing up my stuff, and I'm alone with one man. I don't like your insinuations!"

With difficulty Jim restrained himself. "You can't take your daughter back to-night, and I offered you my quarters—such as they are. But, as for this whispering assistant of yours, I take back my offer. He can't stay here!" The speaker's voice snapped like a brittle stick. "You understand English, don't you, Paradis?"

The room went silent. In the glance of the girl as she watched Jim's eyes blacken with anger, was amusement and approval.

With a swift movement the enraged Paradis jerked his hand back to his

belt; but the squat Renault's fingers gripped his arm. Then a movement at the window behind the two men drew Jim's attention. Two narrowed eyes in a seamed face were pressed against the pane. Beside the face a hand gripped the action of a rifle. The watchdog, Omar, was on guard. The knife of Paradis would never have left its sheath.

The working features of LeBlond reflected his warring emotions. This man who had saved his daughter had also flagrantly affronted his friend. For a space his sense of gratitude and his loyalty to Paradis strove for mastery as he looked into the cold eyes which challenged his. Then he found his voice!

"You have insulted us, here, in your own house!" he burst out. "We want no hospitality from you." Then, as if ashamed, went on: "Oh, I'm grateful—I know what I owe you; but we'll bid you good-night. Come, Aurore!"

Aurore Asserts Her Independence

His answer from the girl was contemptuous laughter, "Oh, you men are so funnee—so funnee!" she cried. "So ridiculous! Because Mr. Stuart knocks down our Paul Paradis, and Paul fills your ears with a fool idea of word not being sent ten miles against that wind and sea, you forget that I'd be down there with the fish to-night if it hadn't been for Omar and Mr. Stuart. Pah! You men are all fools!"

She was serious now, her scornful gaze over-awing her father's uneasy eyes. In frank admiration Stuart watched her as she waited for LeBlond's reply.

"I thank you for what you did for her," said LeBlond at length, turning defeated from the accusing eyes of his daughter. "Come, Aurore!"

Paradis and Renault sullenly left the room while the trader waited at the door for the girl who had not moved.

"So you think, because of the hurt feelings of your pretty Paul, I'll spend the night in front of a fire, with my back against a tree?" she replied. "Well, I will not!"

Over the bold features of LeBlond crept an expression of helplessness—of impotence. It was patent to Stuart that this trader, whose energy and determination were by-words in the fur

trade, was not the master of the girl who now faced him.

"I shall accept Mr. Stuart's offered hospitality," she continued. "As for you, mon pere, you can stay and help old Sarah, the cook, guard the sacred honor of your precious daughter—or you can leave her to Sarah and go and sit by your fire. I stay here. Do you understand English, Monsieur LeBlond?"

In the end, LeBlond and his daughter passed the night in the quarters of Stuart while the indignant Sarah tossed through sleepless hours, outraged by the thought that the roof above her should shelter the enemy who had boasted that the wolves should soon howl in the deserted clearing of Sunset House.

CHAPTER III

SIX years before, when the boat brigade of the North-West Trading Company, in command of one of the partners, Louis LeBlond, had passed through Lake Expanse on the trail to Mitawangagama, the Ojibwas, who were camped at Pelican Portage on their way south to the spring trade with the Hudson's Bay Company, had been greatly excited. Turning in to the camp, LeBlond's head voyageur, Black Jules Renault had announced in their native tongue that a trading station was to be built on the great Lake of the Sand Beaches two hundred miles north. Never again need they take the long trail south to Lake Expanse, but in the next long snows would find a warm welcome—a New Year's feast—and the best of trade goods ready for exchange for their fur at the new post.

In three years LeBlond had made serious inroads into the trade of the old company. He had gone to the Indians in the heart of a rich fur country. He no longer could be ignored. They must follow and fight him for the trade. But, on the word of hardheaded Andrew Christie, of Lake Expanse, Inspector of a territory larger than an eastern state, the man who could now wrest a share of the trade from the firmly entrenched LeBlond would need a particularly long head, boundless nerve, and the tenacity of the beaver. Such a man, Christie told his superiors, in conclave at Winnipeg, he believed was now at God's Lake in western Kiwedini—a young man with a fine war record and a local reputation for ability and judgment in dealing with the Indians.

In two months a mail canoe brought Jim Stuart orders from Winnipeg to report to Christie at Lake Expanse. A month later, with Omar Boisvert and a gang of men, Stuart had cleared the forest and was peeling the logs for the building of Sunset House. The following three years had been for Stuart a well-nigh hopeless struggle for a foothold in the trade, for his rival possessed the Frenchman's uncanny talent for handling the Indians, backed by an experience of thirty years.

A Spoiled Child

As he lay on his bunk in the trade-house, after leaving Aurore LeBlond and her father in possession of his quarters, Jim Stuart's thoughts traversed the hours since mid-afternoon. To the man who, since the war, had been marooned in the forests of Kiwedini—Ojibwa for "The Birthplace of the North Wind,"—the coming of this vivid creature, swept into his life by the accident of wind and sea, had been like the burst of a shell on a black night. To the picture of a dark head beside a submerged canoe which the seas buried as they drove past, his memory joined the dripping figure of a shivering girl, standing in Marthe's doorway, dismissing the adventure as a joke. Then her cool indifference to the scandalized Ojibwas! He had read that they were like that—these present-day girls. He chuckled at the memory of how she rose from the table to display

Under Frozen Stars

(Continued from Page 17)

her whipcords, to the consternation of the inquisitive Sarah. No false modesty there! In fact, he admitted, modesty did not appear to enter into the picture. And how she did seize on gibodieg-wason! It certainly was an insult to the well-cut knickers which set off her shapely legs—that name!

But what a crime it was to cut hair like that! It must have rippled to her waist. Then he laughed aloud as he remembered the disgust in the blue eyes of Mary Christie, daughter of the Inspector at Lake Expanse, when he once asked her when she intended to bob her hair. No, Mary wouldn't cut her hair or shorten her skirts either. Lake Expanse fashions were somewhat behind the times, and—as Mary was the only white girl on the great lake—would remain so.

Of course, the astute LeBlond was set on marrying his daughter off well in Winnipeg. Strange, she'd escaped so long—with those dangerous black eyes and that magnetism. It was magnetism; no doubt about that. The man on the bunk in the trade-house sucked in a deep breath at the memory of his struggle to get the half-drowned girl into the canoe—the dead weight of her in his straining arms.

But strong as was the appeal of this dark daughter of Louis LeBlond to the eyes and senses of the man who had not seen three comely white women in

as many years, she was, he realized, only a spoiled child; vain, headstrong, the pampered darling of a lonely father. Then his thoughts shifted to the loyal, capable girl at Lake Expanse, who ministered with head and hands to the well-being and comfort of his chief, Andrew Christie, and who, except for five years' schooling in Scotland, had spent her life, without complaint, immersed in the northern forests. He pictured her frank disdain of the dress and manners of the girl who slept over in his quarters—her outraged sense of propriety at the direct thought and speech of this self-possessed daughter of the free trader. She wouldn't understand this girl—would condemn her on sight as over-bold, light, unwomanly. But no one who had seen Aurore LeBlond grimly refusing to be swept from her grip on that canoe, as the seas buried her, could doubt the metal of her courage. She had proven that. Whatever else she might lack, it was not a valiant heart; and it was masterful the way she over-awed her father—forced him to stay at Sunset House. Then he found himself comparing the blond comeliness of the decorous daughter of Andrew Christie with the dark loveliness of Aurore LeBlond.

Good-bye

The following morning Stuart walked with his guest to the beach where LeBlond had preceded them to his waiting canoe.

For only 8 cents a word you can place your story of your wants or what you have to sell in over 160,000 homes.

HANDY ANDY Says "Here's How"

Ground Your Barn Equipment

By Ray Inman

Connect each end of hay track to lightning rod cable on roof.
Ground manure carrier near barn door and at farther end.

Ground overhead water pipe where it enters barn.
Connect eave troughs to down cable where it comes over them.

Attach lightning arresters to overhead lighting wires where they enter building.
USE NO LESS THAN NO. 10 COPPER WIRE FOR ALL GROUNDINGS.

For Your Protection

I AM always looking for our mailman and American Agriculturist. I thought perhaps you would like to know of what service you have been to me. A short time ago I read in your paper a warning against a certain concern going around looking for accounts to collect.

Well, one of these same parties came our way and at that time I was busy so he left one of his report blanks for me to fill out and was to return two days later, which he did. He was confronted with your statement and admitted he was the man. Well, you should have seen him get out of the garage and he near burned up his tires to get away. It was quite a laugh to a few people who witnessed it. I was then asked how I found out and I explained to them that I read it in American Agriculturist.—F.E.P., New York.

EDITOR'S NOTE—Letters like this are one of the satisfactions of publishing a farm paper. Our only regret is that our warnings sometimes come after money has been lost. At other times our subscribers ask us about some concern whose history has already appeared in the Service Bureau columns. Read the column regularly and report any suspicious circumstances to us promptly. In this way we can be of the greatest service to you.

Auto Service Associations

OUR readers who follow the Service Bureau columns regularly know that we have never been very enthusiastic about the so-called auto service companies which sell membership and agree to give rebates on gas and oil, furnish towing service under certain conditions and sometimes agree to render other services. A heavy correspondence from our readers indicates that in few or no cases have they received benefit commensurate with the cost. Many let-

"Wonderful Service"

I RECEIVED your letter dated March 6th with check valued at \$125.71 enclosed. I wish to thank you very much for the same and think it is a wonderful thing to be able to safeguard your self against accidents in this way with the A. A.

I don't think your fine service is known well enough around here and I will do my best to boost it and let it be known wherever I can. Thanking you again for such wonderful service, I remain.

Minnie May Cushing.
Holly, N. Y.

Mrs. Cushing was injured in an automobile collision Nov. 4th, 1930 causing an injured knee, and cuts on nose, forehead and left leg.

ters indicate that people who signed up had believed that they were securing liability insurance, which was not the case.

Readers have recently asked us about two associations in New England. The contracts put out by these associations seem to be very similar to many others mentioned by us. The two companies referred to are the Mutual Automobile Association of Boston, Mass. and the North American Automobile Club of Boston, Mass.

Two Insurance Policies

My husband was hurt in an auto collision recently. He had an insurance policy in the North American Accident Insurance Company and filed a claim which was paid at once. We appreciate this money very much as we live on a farm and have to hire most of the work done while my husband is ill.

My husband also had a policy in the National Protective Insurance Company but they refused to pay. My husband is in bed for six weeks. I am wondering if

you would write to the National Protective Insurance Company, asking them if they will not reconsider their decision to pay our claim on this case.

WE were very glad to write to the National Protective Insurance Association who replied as follows:

"We have received your letter. The proofs which were submitted to us showed that we have no liability as set forth in our policy. The claim was declined accord-

A Helping Hand

I RECEIVED a check from . . . at last and I feel greatly indebted to the Service Bureau and appreciate your helping me very much. I am sure I would not have received it if it had not been for your help and will say you are rendering the farmers wonderful service in a great many ways.

The AMERICAN AGRICULTURIST has been in our home over thirty five years and will say it is a farmer's guide and one of his best friends.

Thank you again for your aid.

ing to the proofs that were furnished us."

As we understand the situation, the National Protective Insurance Association is not licensed to do business in the States of New York or Pennsylvania. However, this company is legally allowed to solicit insurance business by mail, although they cannot sell it through insurance agents. We have always taken the position that there are so many insurance companies that are licensed to do business in this state that it is better to do business with licensed companies than with those which are not licensed.

Lease Is Legal

The land through this section has nearly all been leased by gas and oil companies. Most of the signers did not realize that they could not hold any part of the gas if any were struck. Can the lease on the land, by the oil company, hold if the land is sold to someone who wishes to be free of said lease?

MOST of the leases do provide that the owner of the farm gets enough gas for use in his building. Some of them, however, do not provide for one-eighth of the gas as they do for the oil. It is our understanding that a few leases provide that one-eighth of both gas and oil should go to the owner of the farm.

As we understand it when the lease is made it acts as a lien on the property, and that it is binding on anyone who buys or rents the property. In other words, selling or leasing the farm would not release you from the terms of the contract.

Letters Not Answered

QUITE a while ago a subscriber asked us to write to Peter Hosenfeld & Son of Webster, New York, calling to their attention claims for some plants which our subscriber stated they had bought from him.

We called this claim to the attention of Peter Hosenfeld & Son under dates of December 9, January 2, January 21, and March 23. Up to date we have had no reply to any of these letters.

There is always some danger that money will be lost when it is sent through the mail. This is particularly true of coins. May we, therefore suggest that when you have occasion to send money to American Agriculturist, either for subscriptions, patterns, embroidery, trespassing notices, or insurance policies that you send either a check or postal money order. Where amounts are very small, stamps will be acceptable.

GET GOING, MR. WATER-THIN,
GET GOING! YOU'LL WASTE
NO MONEY FOR THIS FARM!

HE'S A champion loafer. For Mr. Water-thin is the quart or more of non-lubricating waste oil that ordinary refining leaves in every gallon of motor oil. A quart that vaporizes far too fast in tractor, truck or car.

But you'll find none of this stuff in Quaker State Motor Oil. For it's removed by special equipment in every one of the Quaker State refineries—the most modern in

the world. And Quaker State replaces this waste with the smoothest lubricant a motor ever purred over!

That means there are four full quarts of rich, full-bodied lubricant in every gallon of Quaker State—not three quarts and one of waste. That means you get an extra quart of lubricant. Which explains why Quaker State is the world's

largest selling Pennsylvania Oil—and the most economical farm lubricant made!

Every gallon of Quaker State is

made entirely from 100% pure Pennsylvania Grade Crude Oil. It is so free from impurities that it doesn't require acid treatment in refining. That's important! For acids tend to destroy some of an oil's oiliness.

Use Quaker State Motor Oil for tractor, truck and passenger car. It will save you money in maintenance costs and in oil costs—for it lubricates better and longer. Try

it! You'll soon be convinced that Quaker State is the biggest bargain in oil!

THERE'S AN EXTRA QUART
OF LUBRICATION IN EVERY GALLON

QUAKER STATE
MOTOR OIL

A SIMPLE WAY to Solve the Surplus Milk Problem . . .

PRODUCERS of fluid or market milk could wipe out the surplus milk which is now depressing milk prices easily and quickly by keeping a small quantity of milk at home and separating enough to provide cream and butter for their home use and skim-milk for feeding a few calves, pigs or chickens. Aside from helping to improve prices this practice would also provide more dairy products—the most healthful and economical of all foods—for home use.

Many dairymen who are now selling whole milk will find that in the long run it will be more profitable for them to separate all their milk and to sell cream or butter and to grow more young stock with the skim-milk—the best feed in the world for this purpose.

Every dairy farm, regardless of how the milk is sold, should have a cream separator—even if it is used to separate only a pailful of milk a day. And when it comes to cream separators, there is nothing like a De Laval.

There are five complete lines of De Laval Separators, ranging in price from \$30 up, providing a De Laval for every need and purse. No matter whether you want to separate the milk from one or 1000 cows, there is a De Laval which will do this work better and at less cost than any other separator. Each De Laval, regardless of price, is the best in its class and the best money can buy. They are:

"3,000,000" GOLDEN SERIES—The world's best separators. The most completely and conveniently equipped, cleanest skimming, easiest running and most durable. Equipped with ball bearings protected against rust and corrosion. Finished in beautiful and durable gold and black. Four sizes, from 350 to 1000 lbs. capacity. Hand, belt or motor drive.

BLACK UTILITY SERIES—Exactly the same as the Golden Series in construction and separating efficiency, but lacking several features. Sold at lower prices. Three sizes: 350 to 750 lbs. capacity.

JUNIOR SERIES—A new quality line of smaller separators for the one to three cow owner. Most efficient and durable. Finished in royal blue. Three sizes: 150, 225 and 300 lbs. capacity.

EUROPA SERIES—Another line of still lower priced small, European-made De Laval Separators. Excellent skimmers. Finished in red. Four sizes: 150 to 400 lbs. capacity.

A DE LAVAL MILKER Will Help You Produce at Less Cost

A De Laval Milker will do more to help you reduce your cost of producing milk than anything you can get. It will enable you to do your milking in at least half the time, and also to do your milking better and produce more and cleaner milk than can be done in any other way.

There are now more than 2,000,000 cows milked with De Laval Milkers in all parts of the world, and in every way De Laval's have demonstrated their superiority over any other method.

There are three kinds of De Laval Milkers, providing a De Laval for every need and purse:

MAGNETIC—The world's best milker. Thousands of outfits in use in all parts of the world. Pulsations controlled by magnetic force insure absolute uniformity of milking. Cows always milked the same way and produce to their greatest ability. Any one can operate it. Easy to handle and care for. Outfits for milking one to 500 or more cows.

UTILITY—The best low-priced milker made. Ideal for the small dairyman or for those to whom price is an essential consideration. Outfits sold from \$145 up. Furnished with single or double units, which can be used with any make of single pipe line milker.

In addition there is the De Laval Magnetic Combine Milker, which milks, weighs and conveys—for large herds and special conditions.

How It Works

Electro-magnetic force creates and controls pulsations in the De Laval Magnetic. Milker with split-second accuracy. Generator A driven from the milker pump creates the current which is timed by a gear-driven device, which is as accurate and positive in action as the distributor on an automobile. Magnetic force is then carried by wire to electro magnets located on the operating top of each unit, B, C and D. Each unit milks at exactly the same speed, which insures uniform milking at all times. Surplus current from the generator can be used to light four electric lights, thus providing free barn light.

New York's New Farm Laws

A Summary Every Farmer Will Want to Read

ONE of the services which AMERICAN AGRICULTURIST tries to do for our readers is to keep them informed on important laws affecting their interest and welfare. In the March 21st issue of AMERICAN AGRICULTURIST we gave a summary up to that time of all the important farm and rural bills introduced into the Legislature at Albany. We promised them to give a complete summary when all of these bills were either signed or vetoed at the close of the Legislative session. At this writing, not quite all of the bills passed by the Legislature have been acted upon by the Governor as he has thirty days after the close of the Legislative session to sign or veto bills. But practically all important bills have been acted upon so we give below our promised review of what the Legislature and the Governor of New York State did do, or did not do, for agriculture this year. We suggest that you save this summary very carefully for future reference and that you read this summary out loud at the next meeting of your Grange or other local farm organization.

Before we take up the actual summary and description of the bills passed, I would like to make a couple of comments. In the first place, this was not an important year from a legislation standpoint. Splendid progress has been made in securing helpful agricultural laws in New York State during the last two years, in fact, the best progress that has ever been made. So it was thought by everybody concerned that this was a good year to slow up a bit, not only to give people a chance to see how the new laws for agriculture would work, but also on account of the State finances and the tax situation.

When the bills were finally passed by the Legislature, the income tax of the State had not yet been paid on April 15th, and when it was paid it was found that this tax was less than half of what it was last year and far below

By E. R. EASTMAN

the expectations of the Legislature. So Governor Roosevelt was faced with the disagreeable job of vetoing appropriation bills with which he was very much in sympathy, but for which there was no money available to carry out their provisions. In the list of bills which Governor Roosevelt vetoed there are at least two that he should have signed and in not signing them he did an injustice to rural people. The first and most important of these was the three-fourth year automobile license bill which was passed by the Legislature and vetoed by the Governor. The second one was a bill abolishing the junior license for young men and women sixteen and seventeen years of age, and substituting in its place a law making it possible for any sixteen year old boy or girl to qualify for a regular driver's license, good everywhere in the State ex-

cept in cities of 250,000 and over. The Governor's veto of the three-fourth year automobile license bill is discussed on our editorial page this time. On the whole, however, the Governor was right in vetoing a large number of the appropriation bills. Most of these and probably all of them were for very worthy purposes and we are for anything that is for the good of agriculture but these appropriation bills meant more public expense at the present time and I am firmly convinced that it is time to call a halt.

It should be said also that on the whole, both the Legislature and the Governor again have done a constructive job for agriculture with both the new laws passed this year and some poor bills which were considered and not passed. Here is a summary of what was done:

TB Eradication Appropriation

In the regular budget submitted to the Legislature early in the session \$2,500,000 was appropriated to carry on the campaign against TB in New York State during 1931. This was passed with the budget. However, it was not considered enough so a special appropriation bill asking for \$1,000,000 more for TB eradication work was introduced as a special bill later in the session. \$500,000 of this special appropriation was to be used to pay indemnity to dairymen for cattle condemned during the last part of 1930, and the other \$500,000 is to be used for work this year. This special bill was passed and signed by the Governor so the State Department of Agriculture and Markets has a total of \$3,000,000 for eradication work in 1931, and \$500,000 to complete the payment of indemnities for work done last year.

New Law Against Oleomargarine

The new act is a splendid victory for dairymen. The old State law against oleomargarine prohibits the manufacture and sale of oleomargarine in imitation of (Contin'd on Page 2)

(Continued from Page 1)

natural butter. The new provision states that oleomargarine shall be deemed to be in imitation or semblance of butter when it has a yellow color similar to the color of butter and states the methods to be used in measuring the color. New Federal legislation was also secured this year along the same line, making it impossible for oleomargarine manufacturers to sell yellow oleo.

Farmers Exempted from Compensation Insurance

There has been a great deal of concern expressed during the past year for fear that farmers could be prosecuted under the compensation insurance law if their hired men were injured in doing

any work not strictly agricultural. To clear up the situation American Agriculturist did considerable work in Albany this year on this matter and Assemblyman Porter introduced a bill which was finally passed and signed by the Governor which definitely permits farmers to engage in logging, lumbering, or woodcutting work with their hired men without being obliged to insure the men, providing that not more than four men are employed by the farmer in such work.

Grading of Farm Products

This new law gives the Commissioner of the Department of Agriculture and Markets the power to establish grades on all farm products. It is optional, as it

does not compel anyone to grade if he does not wish, but if he accepts the grade and marks them according to an established rule, then he is obliged to live up to his grade.

The law also makes it a misdemeanor to put the best products on top or on the face of a barrel or package.

This should operate to improve the quality of New York products put on the market and to hold back low quality products. It will be a step toward aiding New York State farmers to compete with Western and other farmers who long ago learned that the only way to get their products on the Eastern market was to be sure that the quality was right.

A Better Trespass Law

Under the old law when a farmer posted his land posting was good only against hunters and fishermen. Often the worst offenders are campers, automobilists, and others who have no regard for the farmers' property rights. American Agriculturist was active and instrumental in having more teeth put into the trespass law so that when a farmer posts his land, the posting is effective against everybody. We hope that farmers will not be in a hurry to post their land unless they absolutely have to but if they are forced to, the new posting law will be much more effective.

To Develop St. Lawrence Powers

One of the most important laws from everybody's standpoint in New York State, whether they live in country or city, is that passed by the Legislature this year, providing for the development of electric power from the immense natural resources of the St. Lawrence River. After years of argument over the project the Legislature this year passed, and the Governor signed, a bill providing for the appointment of a State commission which will endeavor to start the tremendous engineering job of harnessing the St. Lawrence on a private ownership and development plan under State control.

Official School Year Changed

Under the old school law, the official and fiscal school year began August 1. The law was amended this year to make the school year begin July 1. This will save school officials in a great many cases from the necessity of borrowing money and paying interest on it while waiting for State money to be paid, for it will mean that State moneys will be paid that much earlier than they have been heretofore. This bill had the cordial support of American Agriculturist because it will greatly help local taxpayers and school officials. It was the most important school law passed this year.

Speed Limit on Highways

An important amendment to the highway law extends the speed limit on highways from 30 to 40 miles an hour. Under the old law, of course, everybody at times drove faster than 30 miles an hour but if anything happened the burden of proof certainly was on the driver and technically he could be arrested for exceeding the speed limit. The limit has now been increased 10 miles an hour and is more in line with common sense and modern driving practice.

Proposal to Improve Rural Health Service

A bill recommended by a special health commission appointed by Governor Roosevelt was introduced early in the session which would have made the county the unit of local health administration and also recommended the establishment of two or three county tubercular hospitals similar to the one already now established at Raybrook, New York. The commission recommendations would have eliminated much of the work which is now being done by local health officers in the towns and would have concentrated all of these lines of local health work under the jurisdiction of one county board of health.

The Legislature did not accept the recommendations as a whole, but eliminated all of the provisions of the bill

new
high-power burners
30% faster...

No. R-609 New Range in pastel green, ivory and black. Five High-Power Burners.

Here's the
cooking speed you've often longed for

No more time wasted waiting for the kettle... no more exasperating delay in heating the frying pan. High-Power burners are more than 30% faster.

Will your stove do this? High-Power Perfection boils two quarts of water in less than nine minutes, cooks steak in ten minutes, heats the

oven in six minutes. It is new and radically different—fast as a standard city gas burner. New tilting drums for easy lighting.

Modern designs, porcelain, lacquer and baked enamel finishes. Lovely new color combinations of pastel green, ivory and satin black, ivory and green, and ivory with black.

High-Power Perfections, \$18 and up Strong steel construction. Every burner a High-Power. No pipes or wires, no special installation. See your dealer this week.

BEFORE YOU BUY ANY STOVE Consider the cost of fuel. Kerosene is the cheap, dependable fuel. High-Power Perfection stoves give you the cooking speed of the more costly fuels, using the economical fuel... safe, clean kerosene.

NOW! MODERN ICELESS REFRIGERATION EVERYWHERE!

Superflex Oil Burning Refrigerator. Light the burners once a day. Keeps food fresh and pure, makes ice cubes, right in your kitchen. Also made for use with gas. Send for free booklet. Some distributors' territories still open. Write for franchise details.

Watch Your Step On Potatoes This Year

Growers Plan Increased Acreage---Big Crops Bring Small Returns

A REPORT issued by the United States Department of Agriculture on March 26, 1931, indicates that the potato growers of the United States intend to plant an acreage of potatoes this year almost 11 per cent larger than the acreage harvested in 1930. These figures should give pause to any thinking farmer and particularly to those who depend on potatoes for a large share of their income.

When potato prices have been relatively good for a couple of years, it is the usual custom for growers to increase the acreage. The potato growers of the country are running true to form this year and the fever for increasing potato acreage has spread to all parts of the country. The 1931 acreage in the 13 southern states is expected to increase almost 18 per cent. In the 35 late states, which produce the bulk of the crop, the intended increase in acreage is about 10 per cent.

The crop in the early states is already well on the way and there is nothing to be gained by discussing what might have been. But it is very important to note that the southern crop has been materially delayed by frost and cold weather in all sections except Florida. This means that most of these early states, with large increases in acreage, will get off to a late start. Unless something unusual occurs, this will mean that each group of the southern states will encroach seriously on the regular selling period for the more northern states all along the line. The final result is likely to be a repetition of the experience in the fall of 1928, when the carryover of the intermediate crop of potatoes was so great as to depress very seriously prices for the regular crop of late potatoes.

It is not too late, however, to change plans in the late states. A glance at the table will show that everyone of the 19 surplus states intends to

By DR. M. P. RASMUSSEN
New York State College of Agriculture

increase its acreage to some extent. In the eastern states, the increased acreage runs about 8 per cent. In the west central and western states, however, the increase will be from 13 to 14 per cent. The large crops of potatoes in Maine and Idaho

have effectually determined the prices received for the 1930 crop of potatoes. What will happen in 1931 with a 10 per cent increase in Maine acreage and a 12 per cent increase in Idaho acreage, if temperature and rainfall are normal? These areas, far from market and with relatively high freight rates, have already made much progress in the way of putting quality potatoes on the market. Lower prices in 1931 will merely make them increase these efforts and make it even more difficult for growers in other states, with less rigid standards, to compete.

A number of the 16 deficit states were hard hit by the great drought of 1930. All through this area farmers are being urged to raise enough vegetables to see them through next winter. Many of them seem determined to plant enough potatoes this season so they at least won't go hungry this year. An increased acreage in the 16 deficit states will undoubtedly mean a decreased market outlet for the potatoes produced in the 19 surplus states.

Potato growers throughout the country seem to be ignoring the fact that the potato acreage planted during 1929 and 1930 was entirely ample if weather conditions had been favorable. As a matter of fact, weather conditions were poor during 1929, and extremely unfavorable during 1930, so that the yield during the two years was only 112-113 bushels per acre compared with the normal 120 bushels to the acre.

No one knows what the weather man has in store for us during 1931, but it may be of interest to note that during the past 30 years there have never been three consecutive light yield seasons. The only sensible thing to do is to count on normal weather and normal yields. Normal conditions during 1931 would probably result in a

(Continued on Page 7)

"One For The Cutworm, One For The Crow---"

Corn Planting Time Is Just Around the Corner. Is Everything Ready ?

APPLES are in bloom. The grass is green and as the farmer drives his sweat-stained team toward the barn, he makes his plans for tomorrow's work. Only by planning, can he make the most of these spring like days when crops must be sown if there is to be a harvest. (EDITOR'S NOTE—The best plans must be made long before the previous day).

Corn in the form of ensilage or fodder is the cheapest and best roughage available for milk production and a crop without which the dairyman would be lost. Warm days mean that planting time is here again, with its numerous problems.

Many recommendations are made by various authorities as to the varieties, fertilizers, and methods of planting, but each individual has his own problems and any discussion can only be more or less general.

One of the first problems that confronts the grower is the variety that he should plant. At the present time, seed corn is offered on the market under many different names, often with the same names covering widely different varieties. Unless the origin of the seed is known or the seed is obtained from a reliable dealer, its performance can only be guessed at. For New York State growing conditions the best variety is the one that uses all the average growing season in the production of roughage, including a fair amount of grain. Three years out of five the dough or glazed stage should be reached by the grain. This means a heavy tonnage of green feed in addition.

The New York State college of Agriculture has made

a number of tests of various varieties of silage corn and have more or less decided the variety adapted to our conditions.

West Branch Sweepstakes is perhaps the best known and apparently is the best variety for most conditions in the Northeastern States with the possible exception of the Northern part. It requires a little over four months to grow to maturity. Luce's Favorite is another variety that requires about the same growing season as Sweepstakes but does not yield as high in dry weight or grain. In sections where a higher proportion of grain is desired or where the growing season is too short to grow Sweepstakes satisfactorily, Cornell 11 is a very popular variety.

Popular in the extreme north portion is Golden Glow since it matures even earlier than Cornell 11 or other varieties mentioned. These varieties are but a few of the many

that are sold in New York State and which are satisfactory for northeastern conditions, but they offer a selection, and where obtained from reliable seed sources the grower can be assured of a satisfactory crop.

The corn crop has a place in the rotation on many northeastern farms. Usually following clover sod, fall plowing is desirable if not necessary. This brings up a question that has provoked considerable discussion, some claiming that as good yields can be obtained from corn land plowed two weeks before planting as that which was plowed the fall before. Experiments seemed to have proved that fall plowing offers slightly higher advantages in yield but where time is limited, very good results can be obtained by plowing late.

The corn crop in the dairy section through long custom, usually receives a heavy application of manure, since corn is a heavy user of nitrogen and a large amount of organic material is necessary. We find that ordinarily a clover sod with a heavy application of manure is usually plowed under before the crop.

"Shall I use commercial fertilizers?" is a question

asked by many farmers this year who are short of ready cash. In this connection we have to consider two things, one of which is the keeping down of the total production cost and the other is the keeping down the unit production cost. Fertilizer prices are still low and the addition of three to four hundred pounds of super phosphate or a commercial fertilizer in the row will enable the growing of silage corn at a

Vol. 127 May 9, 1931 No. 19

Cut Your Potato Acreage

POTATO growers throughout the United States have declared intentions to plant about eleven per cent more potatoes this year than they did last. Read the article on this on page 3. There can be but one answer to this foolish policy, and that is, that the prices this fall will be far below the cost of production. If instead of this unwise increase in acreage, potato growers should cut their acreage from twenty-five to fifty per cent and then fertilize and care for the remaining acres intensively, there would be some home of profit above costs, even in these low price times.

When, oh, when, will we learn to heed the sad experience of past years?

Several Agricultural Appropriations Vetoed

MAY we call your attention to the review and summary of important new laws just passed by the New York Legislature and signed by Governor Roosevelt? This review is on the first page of this issue. We suggest that you save it carefully and also that it be read aloud at your next Grange or other local farm organization meeting.

The summary also mentions some important bills that the Governor vetoed. Some of our friends personally interested in certain appropriations will think we are unjust when we state that we are in sympathy with most of the vetoes this year of bills carrying appropriations. Some of these appropriations like those for example, for various buildings for agriculture, were for very worthy purposes, but the regular budget, passed early in the session, was fairly liberal to the different agricultural educational institutions of the State. When the Governor had counted all of the returns from income taxes paid on April 15th, he found that there just was not money enough to pay the special appropriations in the various bills that the Legislature had passed, in addition to the regular budget. In spite of the fact that he was in sympathy with most of these appropriations for agriculture, he was obliged to veto them for the same reason that the individual farmer stops buying many things he wants when his money runs out.

It is very evident that expenditures of public money must be brought in line with the decline in prices of everything the farmer has to sell. This tax situation is becoming desperate, and we cannot expect taxes to be any lower if we ourselves keep demanding more and more service

from the Government. Except for absolute necessities in the way of public service, we believe it is time to take a hitch in our belts and try to get along for the next few years on the excellent service that is now being rendered, without trying to increase it or to add to its cost.

Our only reservation on a policy of this kind is that agriculture should get its just share, and there should be a continuation of the policy of the State's assuming more of the local tax burden and of the general equalization of taxes, so as to take more and more of it off from real estate.

Better Farm Conditions In the East

WE make no attempt to tell farmers that times are good when they are bad, and the present economic depression is bad—just about the worst ever. However, it may help a little bit to try to see, occasionally, any factor that seems to be encouraging.

The Brookmire Economic Service gave recently a detailed report of farm income as estimated from final crop reports. This showed that every agricultural section in the United States had declined in prices in 1930, as compared with 1929, but, and this is the interesting fact, the two great dairy sections of the country showed less decline than any other farm section in the United States. What is known as the Western Dairy Belt, comprising the states of Michigan, Wisconsin, and Minnesota, showed a percentage decline of only fifteen per cent, and the Eastern Dairy Belt, including Pennsylvania, New York, New Jersey, and the New England states, showed a decline of only sixteen per cent. All other sections showed greater declines in what farmers receive for their products, the average for the United States as a whole being twenty-two per cent.

An Unjust Veto

GOVERNOR ROOSEVELT made a mistake and worked an injustice to a large number of rural people when he vetoed the three-quarter year automobile license bill. There are thousands of farmers living on dirt roads, the very ones who pay large road taxes and get little benefit from them, who are obliged to put their cars up late in the fall and keep them there, because of bad roads and weather, until spring. It is wrong for these farmers to have to pay a license fee on these cars while they are in storage.

The bill passed by the Legislature would have enabled such farmers and others to pay a smaller license fee covering three-quarters of the year, from the first of March. We understand the Governor vetoed the bill because the State is short of money. We are in full sympathy with the Governor in his predicament of having to veto good bills because there is not money enough to pay for them, but this was a case of plain justice, where farmers who have had the least help from the State are paying taxes for which they receive no return.

Maybe a Good Time to Make Your Own Butter

MILK production, unfortunately, is increasing at the same time that consumption is falling off. The Dairymen's League reports that production now is at least twelve pounds per day per dairy more than it was a year or two years ago.

It may be impractical for the large producers of fluid milk to keep one day's milk home once a week in order to make butter, but if this could be done, it would relieve the market surplus and result in enough better prices to pay for the milk kept home, even if it were thrown into the ditch.

The sad part of it is that it is almost impossible to buy good butter right in the best dairy districts, and it is also true that many dairymen themselves are eating oleomargarine. A good separator is fairly cheap, now, and fresh skim milk is fine for hogs, hens, and calves. It would

seem that there ought to be some practical way whereby a farmer, or possibly two or three neighbors, could arrange to buy a community separator and have good butter during these bad milk marketing times, and, at the same time, keep some of the surplus off from the market.

Such a plan is certainly practical for the small dairyman with five cows or less. In fact, if he counts the value of his skim milk in raising calves or for other stock, he will probably get just about as much out of separating his milk at home as he will to put it on the fluid milk market during the next few months.

Hope for Connecticut Dirt Road Farmers

GOVERNOR CROSS, of Connecticut, has just signed a dirt road bill of interest to millions of farmers throughout the land. The bill calls for an appropriation of three million dollars annually for the next two years, to be used in the improvement of dirt roads of the State of Connecticut. The money will be divided equally among the one hundred and sixty-nine towns of the State, to be used as they desire.

Slowly but surely signs are beginning to appear that the agitation for better dirt roads is having good results. Three million dollars in the small State of Connecticut is a real start toward better roads, and we congratulate the Governor, the Legislature, and the farmers of Connecticut for this forward-looking step.

Farm Wages Down

FARM wages will be the lowest this spring that they have been in many a long year.

According to the Department of Agriculture, day wages of farm workers not provided with board average \$1.80 per day for the country as a whole. This is unfortunate for farm workers, but working at any living wage is better than no work at all, as thousands of city people have learned to their sorrow during this hard winter.

Farmers who hire must take into consideration the fact that farm prices for the coming year will be low and that the only way to make a profit will be to keep all costs, including those of labor, as low as possible. Perhaps it is unnecessary to add that in hiring help one must be fair, particularly in hiring married men with families, to give them a wage on which they can live.

Eastman's Chestnut

THE following certainly needs no comment from me. It is said to be a letter received by a forest ranger of California, and I stole it from my friend, M. H. Hoover, editor of the *New York Conservationist*.

"Kind and Respected Sir:

"I see in the paper that a man named J— S— was attacked and set up by a bare whose cubs he was trying to git when the she bare came up and stooped him by eatin him up in the mountains near your town. What i want to know is did it kill him or was he only partly et up and was he from this place and all about that bare. I don't konw but what he is a distant husband of mine. My first husband was of that name and I supposed he was killed in the war but the name of the man the bare et being the same i thought it might be him after all and i thought to know if he wasn't killed either in the war or by the bare for I have been married twice since and their ought to be divorce papers got out by him or me if the bare did not eat him all up. If it is him you will know it by him having six toes on the left foot. He also sings base and has a spread eagle tattooed on his front chest and a ankor on his right arm which you will know him if the bare did not eat up these parts of him. If alive don't tell him I am married to J— W— for he never liked J—. Mebbe you had better let on as if i am ded but find out all you can about him without him knowing anything what it is for. That is if the bare did not eat him all up. If it did I don't see you can do anything and you needn't take any trouble. My respekt to your family and please ancer back.

"P. S.—Was the bare killed. Also was he married again and did he leave any property worth me laying claim to?"

Four Horseshoes + Two Pegs = Fun

Get Your Eye and Arm in Trim for the State Fair Championship

TO some folks, pitching horseshoes at a stake may appear to be childish, foolish, and altogether a waste of time. Once you get inoculated with the horseshoe pitching bug, though, what a satisfaction you get when the old shoe hits the mark and neatly encircles the peg. Americans both in the city and in the country spend a high percentage of their time in shooting at a mark. They say that the business man sets up a goal which he hopes to gain by the end of the year, and another goal which he is looking forward to attaining before he dies. The young farmer who buys a farm has as his immediate goal the final payment for it and the burning of the mortgage. His more immediate goal is to get a good crop and market his stuff profitably, or to build up a high producing bunch of livestock.

When we play we are still shooting at a mark. Many of us enjoy putting up a target and with a 22 rifle seeing how close we can come to the bull's eye. When our young folks play basketball the target is the basket, or when they try out for the track team the mark may be the record that some other fellow has set.

The good old game of barnyard golf is just another example of the fascination of shooting at a mark. It looks easy to see an expert take a shoe and with apparent ease shoot at 40 feet to score a ringer or at least to drop it so close that it touches the stake. It looks easy but appearances are sometimes deceiving. Just try it a few times. You may be a little peeved to find that your shoes are a long way away from the stake, but before you know it you will be so fascinated with the game that the Missus will have trouble in getting you to leave it to eat your meals.

Since 1924, AMERICAN AGRICULTURIST, in cooperation with the State Farm Bureau Federation, and the State Fair officials, has conducted an amateur championship barnyard golf tournament. Next fall on Tuesday and Wednesday of Fair week we will be at it again. Some folks have the knack of dropping the shoe so that it circles the peg, but anyone, by constant practice, can improve. The peg may be the immediate goal, but why not set up a goal a little farther away, namely, that you shall be the one to represent your county at the State Fair tournament next fall and more than that, why not set up a goal that you will top the list when the tournament is over?

You may wonder just how to go about making your entry. Last fall 36 counties sent representatives to the tournament. Most of these counties will undoubtedly have representatives this year. The first thing for you to do is to practice up. Then inquire of your county farm bureau manager whether your county is to be represented at the State Fair. If it was not represented last year that is no reason why it should not enter this year. Every county conducts an elimination contest, usually at their annual picnic, to decide who is to go to the Syracuse tournament. Entrants at the Fair must be certified by their county agent.

It is interesting to note the steady improvement that has taken place since the tournament was started in 1924. Then, the grand total showed that 7.7

per cent of the shoes pitched were ringers. With one exception there has been a steady improvement. In 1925 the percentage was 17.9 per cent; in '26, 21.2 per cent; in '27, 26.7 per cent; in '28, 31.6 per cent; in '29, 33.3 per cent; and in '30, 32.3 per cent. Last year, however, it is interesting to note that those who participated in the finals, threw 35.6 per cent ringers, more than one ringer for every three shoes pitched. This will give you some idea of the mark you will have to shoot at if you intend to carry off the prize next fall.

In order that you may know the rules under which the contest is conducted, we are giving you the special rules for this contest. Questions not

covered by the special rules will be governed by the official rules of the National Horseshoe Pitching Association. We will be glad to send these rules to any subscriber who requests them. For a copy of these rules or for any information you may wish on the contest write to H. L. Cosline, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City.

Special Rules for the Contest

1. Tournament to be singles only.
2. Each county entering the State Fair tournament must send one man.
3. An entrance fee of two dollars will be required of all contestants, but this will be returned to the player un-

less he fails to finish. It is fair to everyone that those who start shall stay with the tournament until it is completed. Every contestant is expected to stay through to the end of the tournament on the second day, and to stay at the games all of the time, even when not playing, unless excused by the management. Failure to do this will result in the forfeiture of the two dollars. The reason for this rule is that the contestants are needed to help keep the records.

4. Counties must do their own eliminating and may decide their own rules for such eliminating. In order to avoid misunderstandings, no candidate will

(Continued on Page 10)

In One Hundred Years

MACMASTER in his "History of the People of the United States" says:

"The Massachusetts farmer who witnessed the Revolution plowed his land with the wooden bull plow, sowed his grain broadcast, and when it was ripe, cut it with a scythe and threshed it out on his barn floor with a flail."

The great change in the standards of

living of people in the comparatively brief time since the American Revolution has been due almost entirely to the introduction of machinery. In fact, most of the changes have come about since the invention of the reaper by Cyrus McCormick, the centennial of which is being celebrated this year.

It is hard to measure the effect that modern farm machinery has had not only upon farmers and agriculture but on everybody. Some say that all of this new machinery has brought us the evils

in our economic life that are hard to contend with. For example, machinery probably more than any other factor has been responsible for over-production. It would seem, however, that our chief trouble is not in producing too much, but rather in our failure to distribute efficiently our products to a hungry and needy world.

Anyway, there is one thing certain: we are never going back to the hand tools and to the drudgery of hand work. Hand labor in the days of our fathers

Cyrus Hall McCormick (1809-1884), inventor of the world's first successful reaper. McCormick was but 22 years of age when his invention was given its first public test in July, 1831, in a field near Steele's Tavern, Rockbridge County, Virginia.

One of the many field tests of the World's First Reaper, invented by Cyrus Hall McCormick. Jo Anderson, a trusted negro helper, rakes the cut grain from the platform while a farm boy rides the horse.

The cradle was the most efficient means of cutting grain before McCormick's invention of the reaper in 1831. In cradling grain, two acres was considered a day's work. One man was required to bind the grain into sheaves as it was cut by the cradler.

on the farm was monotonous and tiring. Yet, we have lost something in the pride which our fathers took in their skilled hand work. Most of us remember watching an old cradler cut a swath up across a hillside grain field, cutting the grain smoothly, evenly, and laying it back with the heads as straight as a string.

Yet, we will not bemoan the passing of the cradle too much, for at best it was a primitive tool. When McCormick invented the reaper, it was the symbol of the passing of the world from the hand to the machine age. Compare the cradle of our fathers' time to the modern combine which cuts, threshes, and bags great fields of grain in one working day, and you will get some measure of the change that has taken place since the cradling and flailing days, well within the memory of living men.

Harvester and Twine Binder built in 1883. The frame was made entirely of wood, iron being used only for gears, braces, etc.

A 10 or 12-foot cut Harvester Thresher which harvests and threshes the crop on 25 to 40 acres a day.

"The crows went over and pulled my neighbor's corn"

Writes J. E. Meyers, of West Salem, Ohio. From the day he started using Stanley's Crow Repellent his crow, gopher, mole and other corn field pest troubles were over.

But be sure you specify Stanley's Crow Repellent. "It is the only kind I have used with complete success," writes S. Shepherd, West Townsend, Mass. Non poisonous. Will not clog

seed planter. Safe. Sure. A 20 years' successful record.

Large can, enough for 2 bu. of seed-corn (8 to 10 acres) \$1.50. Half size can \$1.00. If your hardware, drug, or seed store doesn't have it in stock order direct. "Money Back" guarantee. Address The Cedar Hill Formulae Co., Box 500-M, New Britain, Conn.

Be sure you get STANLEY'S CROW REPELLENT

Time Well Spent—

Time taken to read the advertisements in AMERICAN AGRICULTURIST is time well spent—for there is no better way to keep well informed on new things on the market, what to buy at what price and where to go to get what you want. When you answer an "ad," be sure to mention the name of

A.A.'s Western New York Farm and Home Talk

Weather Talk

By M. C. BURRITT

IT was Mark Twain who said that everybody talks about the weather but nobody does anything about it. Well that isn't literally true for we all do many things to guard against or to take advantage of the weather. But it

M. C. Burritt

is true that farmers are pretty generally at the mercy of the weather. And because this is true, we watch weather conditions very closely and talk about them a great deal. It has been a dry spring. We have had no two or three day soaking rains as usual at this time of year. The rains

we have had have been quickly absorbed into the comparatively dry ground. Nothing is suffering as yet, but more rain is essential for adequate crop growth. Another light but most helpful and welcome rain is falling today, brightening lawns and meadows.

Much plowing has been done in the last ten days. The greater part of the spring grain has been sown. The ground fits up well and the grain has gone in under very favorable conditions. The fine warm rain which has now fallen ought to give it an excellent start. I do not think that the acreage is as large as usual, probably because grain is so cheap. Wheat, meadows, and alfalfa have come through the winter exceptionally well with little or no heaving and they look well. All they need to make a good crop is plenty of moisture.

Warm Weather Starts Buds

April 17 to 21 was a very warm sunny period the temperature rising as high as 84 degrees Fahrenheit on one of these days. An inevitable result was the rapid opening of the buds and the coming to life of insects. On the 18th, Rosy Aphis began to hatch. By the 22nd they were becoming numerous and leaf "ears" from a quarter to a half inch long had appeared. It was time to start the delayed dormant spray using nicotine. The army of spray rigs was called out by the Farm Bureau spray services and the annual fight for clean fruit was on. Then suddenly the weather changed and a light rain began. It grew colder and a high wind arose. Development of buds was put in cold storage and has hardly changed from the 22nd to the 26th. Some have continued spraying. Others have waited for warmer weather again. Today a warm rain will encourage scab development and those who have the spray on will have protection against an early infection.

In general, and as it now appears, there will be a good bloom and a crop prospect better than usual for fruits. Baldwin and Greening especially give good promise of a big bloom. Other and earlier varieties are not so good but vary somewhat according to last year's crop. Our Wealthys, for example, are blooming very lightly after a full crop last year. Kings, though bearing a good crop last year, will apparently bloom well again while Twenty Ounce are not budded as well. Pears appear to be budded rather light, but plums promise a heavy bloom. Peaches are spotted but apparently the prospect for a crop is fairly good.

Radio Important on the Farm

When one stops to think of it, he cannot but be impressed by the very large place which the radio is coming to occupy in farm life, especially evenings and Sundays. It brings news, markets, fine musical programs, instructive talks, sermons, and great quantities of jazz and other rubbish. Most programs are carrying increasing amounts of advertising. Some of it is fair enough, but much of it is extrava-

gant in its claims and far from the probable facts; some of it is actually offensive with its blatant claims or its intriguing insinuations. This question of radio control is one which must have some careful, thoughtful study. Anyone interested will find a series of six articles in "The Christian Century" (Chicago) on the "Freedom of the Air" both illuminating and stimulating.—Hilton, N. Y., April 26, 1931.

Red Mite Control

What treatment would you advise for red mite control?

THE problem of the individual grower varies according to his location. In the Hudson River Valley where they have red mites, a 3% oil emulsion is used with a great deal of success. In Western New York, where most of the fruit growers use lime sulphur 1-40, control seems to be moderate. On the other hand, in the case of the peach orchards where some infestations of red mite are shown, growers can use 1% white oil with 1/2 pint of nicotine for every hundred gallons of summer apples. This treatment would also apply to plums and prunes.

Nitrate in the Orchard

We have used nitrate carriers in our orchard for the past five years. Would it be better to sow acid phosphate next spring without any nitrate?

THE application of fertilizer would depend upon whether the orchard is in sod or whether it is cultivated. For a sod orchard there seems to be no question but what an application of nitrogen each year is advisable. On some soils where a legume sod is kept, it may not be necessary. The acid phosphate would be very helpful in growing a leguminous cover crop but is probably of little direct benefit to fruit trees.

Bud Moth Control

Is there an absolute apple control for bud moth?

A THOROUGH spraying in the delayed dormant period with nicotine will control the bud moth. Summer sprays will also control the codling moth. If a severe infestation is present it may be necessary to make a special application of nicotine when the green tissues are showing on the apple buds.

Green and Rosy Aphis

Is the fruit grower apt to have much trouble with the green and rosy aphis in 1931?

THERE were plenty of eggs laid last fall to result in a good start for the aphis this spring. The small number that was hatched last year was due to the natural enemies of aphis.

Night Spraying

We have heard considerable about night spraying. Would you consider it worthwhile?

NIGHT spraying has been done in Ohio by Farnsworth. Practically all of his spraying is done at night. Nights are more likely to be still and there is less danger from burning at night.

Redbug Injury

Please discuss redbug injury. What are the corrective measures and is this insect increasing in New York State?

APPLE redbugs are controlled by a nicotine applied in the calyx spray. This insect is common in some sections of the State, but apparently there has been no general increase in the past year.

Watch Your Step on Potatoes This Year

(Continued from Page 3)

yield of 115 to 118 bushels per acre. If this yield is obtained on the acreage forecast, the 1931 crop of potatoes will probably run from 423 to 434 millions of bushels. During 1930, there were produced 361 million bushels and the market has been an extremely draggy and lifeless affair ever since the late crop came on the market.

Sweet Potato Acreage Much Greater

Reports from important sweet potato states indicate the likelihood of an increase of 20 to 25 per cent in the sweet potato acreage. If the yield equals the 10-year average of about 93 bushels per acre, this may mean about 96 million bushels of sweet potatoes during 1931, compared with 71 millions in 1930, and 85 millions in 1929. Sweet potatoes are strong competitors of late white potatoes.

Unemployment and Home Gardens

There is a large amount of unemployment throughout the United States and it is inevitable that large numbers of the unemployed will engage in the intensive cultivation of garden plots. It thus appears likely that an appreciable portion of the population, who usually buy their potatoes, will try to raise them this year and thus be out of the market just at the time when an extraordinarily large crop is likely to appear.

Potato Prices Relatively High

And finally, it must be admitted that potato prices have held up relatively well during the past two years, when other food prices were falling rather rapidly. In March, 1931, the index number of prices received by farmers in the United States for potatoes stood at 127 compared with the general price level of all farm products of 88. In other words, whereas potato prices are about 27 per cent *above* prewar prices, the general level of all farm products is 12 per cent *below* prewar. Prices of eggs were 21 per cent and apples 2 per cent *below* prewar in March, 1931. There have been drastic declines in the prices of most food commodities. In times of severe business depression such as the present, it is doubtful whether one food commodity can long remain out of line with others.

What to do this Year

Every farm constitutes a farm management problem in itself and each farmer must decide for himself how he can use his time and his farm plant to best advantage. This certainly is the year to watch costs carefully, cut them to the bone, and prepare for the worst. It is more than likely that there will be either a limited or no market at all for No. 2 potatoes this Fall if normal weather occurs. Costs should, therefore, be figured on the basis of the out-turn of U. S. No. 1 potatoes. Even with extremely low prices, however, many farmers will still find that potatoes will pay more for their time than any alternative crop. But unless potatoes can be produced for less than 35 to 50 cents per bushel, it will probably not pay to *expand* the potato business this year. As a matter of fact, it would probably be infinitely better for all potato growers in the United States if they did not increase the potato area a single acre during 1931.

"One For The Cutworm—One For The Crow"

(Continued from Page 3)

material reduction in cost per ton.

With the corn ground plowed and harrowed, with the seed of a suitable variety bought from a reliable concern, commercial fertilizer ready to apply, the corn is ready to plant. In this connection, we might mention the use of coal tar, or commercial crow repellent which may be applied to the seed.

In most of our dairy sections corn is planted with a two-row horse drawn planter either with drills or check rows. In sections where weeds are very heavy

check rows enable the cultivation both ways, but if land is free from weeds corn in drills will produce larger yields per acre. In planting, care should be taken that the planter is adjusted to drop the proper number of kernels, which may be determined by running the machine before entering the field. See that the corn is being planted at the proper depth, from one to two inches being sufficient and that the fertilizer attachment is working properly.

As he looks back over the long straight rows the farmer has a feeling of satisfaction in a job well done, and in his mind he sees the corn as it will be in the fall, long rows of tasseled green.

Pea Aphid Control

PEA growers have on occasion suffered considerably from heavy infestations of pea aphids. These tiny insects increase with incredible rapidity and a good many times it seems as if there is very little that can be done to control them. However, the New Jersey Experiment Station reports a successful control by dusting with a dust made of 50 pounds of hydrated lime and three pints of black leaf forty mixed and applied immediately.

QUICK WORK? Yes Sir!

do a fast,
timely,
labor-saving
job with

McCORMICK-DEERING Hay Tools

Above: For speedy cutting nothing equals this 14-foot Farmall Mowing Outfit—the Farmall 7-foot Power Mower and a special 7-foot Trailer Mower. This outfit can mow as much as 60 acres a day. *Below:* Eighteen outstanding advantages make the McCormick-Deering Mower the best of haymakers. It cuts clean and fast, doesn't bind or clog, is light draft, and built strong to give long service. Vertical and High-Lift types available.

SLOW, laborious tools and methods used in making hay have had their day. Modern, low-cost haying calls for fast time- and labor-saving hay tools built for speed and efficiency—ready to lower your haying costs.

The McCormick-Deering dealer offers you the best to be had in mowers, rakes, stackers, balers, and power to match, for every haying operation. Make it a point to see *first* what he offers when you need new equipment.

Before you begin making hay, see the McCormick-Deering Cylinder-Rake Hay Loader—the new, one-man outfit that picks up from either swath or windrow. It is especially valuable now because of its cost-reducing possibilities and because it is built entirely of steel with the exception of the rake bars. Ask the McCormick-Deering dealer to point out its many tested, practical features. Write for a folder.
